RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995
Date Data Arrived at EDR: 07/03/1995

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007
Date Made Active in Reports: 04/10/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 01/03/2018
Date Data Arrived at EDR: 02/14/2018

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

CASHMAN ELEMENTARY SCHOOL
193 LIONS MOUTH RD
AMESBURY, MA 01913

TARGET PROPERTY COORDINATES

Latitude (North):	42.857239 - 42° 51' 26.06''
Longitude (West):	70.948354 - 70° 56' 54.07''
Universal Tranverse Mercator:	Zone 19
UTM X (Meters):	340818.9
UTM Y (Meters):	4746588.0
Elevation:	105 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5644860 NEWBURYPORT WEST, MA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

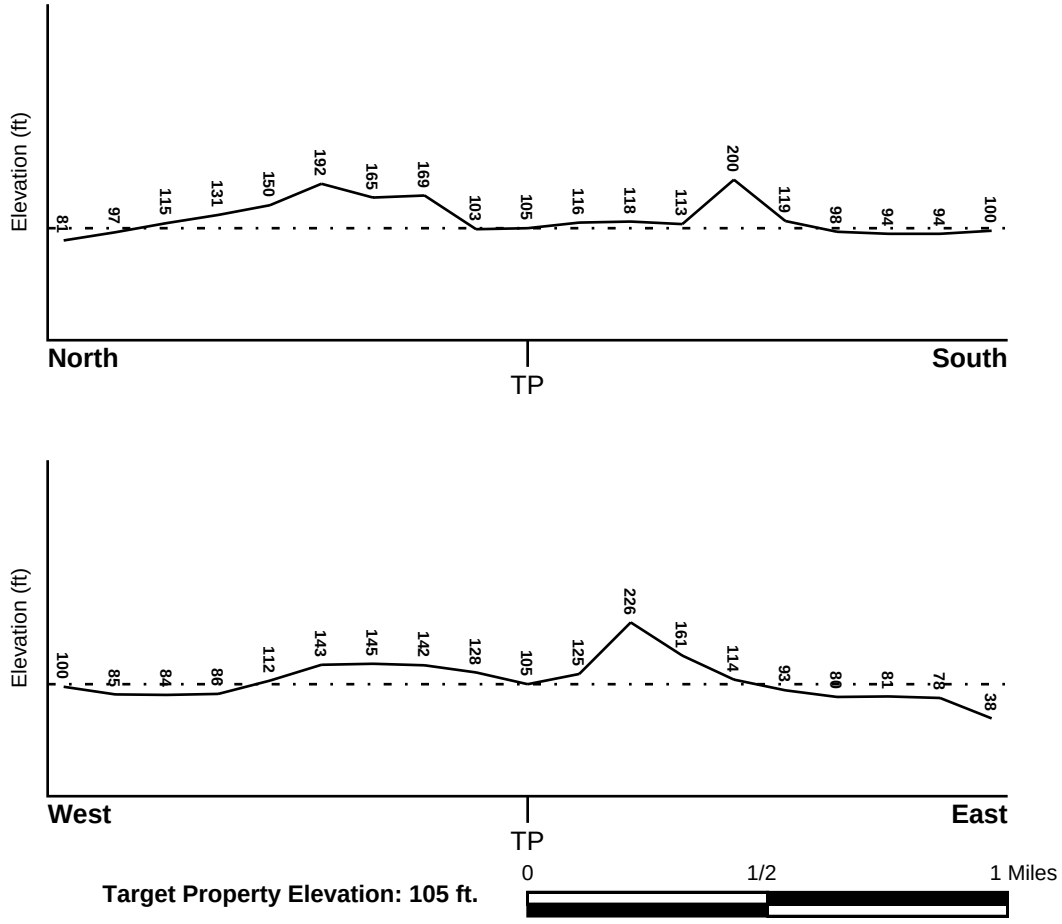
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
33015C0602E	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
25009C0106F	FEMA FIRM Flood data
25009C0104F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
NEWBURYPORT WEST	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Charlton

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	3 inches	fine sandy loam	Not reported	Not reported	Max: 42.34 Min: 4.23	Max: 6 Min: 4.5
2	3 inches	27 inches	gravelly fine sandy loam	Not reported	Not reported	Max: 42.34 Min: 4.23	Max: 6 Min: 4.5
3	27 inches	59 inches	gravelly fine sandy loam	Not reported	Not reported	Max: 42.34 Min: 4.23	Max: 6 Min: 4.5

Soil Map ID: 2

Soil Component Name: Leicester

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Poorly drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 23 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches	fine sandy loam	Not reported	Not reported	Max: 141.14 Min: 4.23	Max: 5.5 Min: 4.5
2	5 inches	27 inches	fine sandy loam	Not reported	Not reported	Max: 141.14 Min: 4.23	Max: 5.5 Min: 4.5
3	27 inches	59 inches	gravelly fine sandy loam	Not reported	Not reported	Max: 141.14 Min: 4.23	Max: 5.5 Min: 4.5

Soil Map ID: 3

Soil Component Name: Charlton

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 75 inches

Soil Layer Information

Soil Component Name: Water

Soil Surface Texture: fine sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory

Telephone: 617-292-5907

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Massachusetts Geographic Information System (MassGIS) Datalayers
Source: Executive Office of Environmental Affairs

Public Water Supply Database: The Public Water Supply datalayer contains the locations of public community surface and groundwater supply sources and public non-community supply sources as defined in 310 CMR 22.00.

OTHER STATE DATABASE INFORMATION

Areas of Critical Environmental Concern Datalayer: The Areas of Critical Environmental Concern (ACEC) datalayer shows the location of areas that have been designated ACECs by the Secretary of Environmental Affairs. ACEC designation requires greater environmental review of certain kinds of proposed development under state jurisdiction within the ACEC boundaries. The ACEC Program is administered by the Department of Environmental Management (DEM) on behalf of the Secretary of Environmental Affairs. The Massachusetts Coastal Zone Management (MCZM) Office managed the original Coastal ACEC Program from 1978 to 1993, and continues to play a key role in monitoring coastal ACECs. Procedures for ACEC designation and the general policies governing the effects of designation are contained in the ACEC regulations (301 CMR 12.00). The ACEC datalayer has been compiled by MCZM and DEM and includes both coastal and inland areas.

EPA Designated Sole Source Aquifers Datalayer: The Sole Source Aquifer datalayer was compiled by the Department of Environmental Protection (DEP) Division of Water Supply (DWS). Seven Sole Source Aquifers have been designated by the US Environmental Protection Agency (EPA) for Massachusetts. A Sole Source Aquifer (SSA) is an aquifer designated by US EPA as the sole or principal source of drinking water for a given aquifer service area; that is, an aquifer which is needed to supply 50% or more of the drinking water for that area and for which there are no reasonably available alternative sources should that aquifer become contaminated. The aquifers were defined by a EPA hydrogeologist.

Aquifers Datalayer: MassGIS produced an aquifer datalayer composed of 20 individual panels, generally based on the boundaries of the major drainage basins. Areas of high and medium yield were mapped. This datalayer includes polygon attribute coding to help in the identification of areas in which cleanup of hazardous waste sites must meet drinking water standards, as defined in the Massachusetts Contingency Plan (MCP) (310 CMR 40.00000).

Non-Potential Drinking Water Source Areas: Non-Potential Drinking Water Source Areas (NPDWSA) are regulatory in nature, representing one of many considerations used in determining the standards to which ground water must be cleaned in the event of a release of oil or hazardous material. NPDWSAs are not based on existing water quality and do not indicate poor ambient conditions.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

DEP Approved Zone IIs Datalayer: The Department of Environmental Protection (DEP) approved Zone IIs datalayer was compiled by the DEP Division of Water Supply (DWS). The database contains 281 approved Zone IIs statewide. As stated in 310 CMR 22.02, a Zone II is "that area of an aquifer which contributes water to a well under the most severe pumping and recharge conditions that can be realistically anticipated (180 days of pumping at safe yield, with no recharge from precipitation.) It is bounded by the groundwater divides which result from pumping the well and by the contact of the aquifer with less permeable materials such as till or bedrock. In some cases, streams or lakes may act as recharge boundaries. In all cases, Zone IIs shall extend up gradient to its point of intersection with prevailing hydrogeologic boundaries (a groundwater flow divide, a contact with till or bedrock, or a recharge boundary)." These data are used in association with the Public Water Supplies datalayer. The following describes certain unique features of this association.

- Any proposed new well which will pump at least 100,000 gallons per day must have a Zone II delineation completed and approved by DEP prior to the well coming on line.
- Additionally, a new source may not be on-line yet, but other, older wells may fall within its Zone II boundary.
- Further, existing wells must have a Zone II delineated as a condition of receiving a water withdrawal permit under the Water Management Act.

RADON

State Database: MA Radon
Source: Department of Health
Telephone: 413-586-7525
Radon Test Results

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

RE: Records Review
Amesbury Elementary School and Cashman Elementary School
Amesbury, Massachusetts
***ECMS* Project 1009.073**

Dear Deputy Chief Nolan:

Environmental & Construction Management Services, Inc. (*ECMS*) is currently working for the *City of Amesbury* and its architect *DiNisco Design* with respect to potential two (2) potential sites on which to build a new school.

We would like to request a records review for the Amesbury Elementary School at 20 South Hampton Road and Cashman Elementary School at 193 Lions Mouth Road properties.

Please let me know if a fee is associated with this request, as I will be performing site inspections at both schools on Tuesday August 21st and can drop off a payment and pick up any documentation available.

If you have any questions, please contact me at (617) 338-2121 Ext. 2 (office) or (617) 925-2121 (mobile).

Sincerely,

For ***Environmental & Construction Management Services, Inc.*** by,

Kevin J. Kavanaugh, L.S.P., CHMM

Re: ACM PLM Sample Results – Cashman Elementary School
Amesbury, Massachusetts
ECMS Project No. 1009.073

Dear Ms. Low:

Pursuant to a request from *DiNisco Design*, *Environmental & Construction Management Services, Inc.* (*ECMS*) collected bulk samples of materials suspected to contain asbestos that may be disturbed by planned renovations. Sampling was conducted on June 3 and August 8, 2020.

Asbestos Sampling

ECMS, working with a masonry contractor, removed bricks from the retaining wall to determine if damp proofing was present. *ECMS* also dug a small trench along the foundation of the wall to search for sub-grade damp proofing. No damp proofing was identified.

The suspect materials identified and sampled were as follows:

Retaining Wall sampled June 3, 2020

- Expansion Joint Caulk
- Glazing, Window

Concession Stand sampled June 3, 2020

- Roofing Shingles
- Roofing Tar

Concession Stand sampled August 8, 2020

- Joint Compound (walls & ceilings)
- Sheetrock (walls & ceilings)
- Mastic, Vinyl Wall Covering

Shed sampled August 8, 2020

- Roofing Shingles

Bulk samples collected were taken to *Asbestos Identification Lab* for analysis using Polarized Light Microscopy with dispersion staining. The visual estimation technique was used to quantify all reported asbestos concentrations (unless otherwise noted).

Asbestos was not detected in any of the samples collected.

Recommendations - Asbestos

Should any additional materials be encountered during renovation, suspect ACM should be sampled to determine if the affected materials must be treated as ACM. Should additional suspect ACMs be encountered during any renovation or demolition activities, work should be discontinued until samples of the suspect materials can be obtained for analysis.

If you have any questions or concerns, please contact us at (617) 338-2121.

Sincerely,

For ***Environmental & Construction Management Services, Inc.*** by,

Holly Drum

Analysis Method: BULK PLM ANALYSIS EPA/600/R-93/116

Dear Holly Drum,

Asbestos Identification Laboratory has completed the analysis of the samples from your office for the above referenced project. The information and analysis contained in this report have been generated using the EPA /600/R-93/116 Method for the Determination of Asbestos in Bulk Building Materials. Materials or products that contain more than 1% of any kind or combination of asbestos are considered an asbestos containing building material as determined by the EPA. This Polarized Light Microscope (PLM) technique may be performed either by visual estimation or point counting. Point counting provides a determination of the area percentage of asbestos in a sample. If the asbestos is estimated to be less than 10% by visual estimation of friable material, the determination may be repeated using the point counting technique. The results of the point counting supersede visual PLM results. Results in this report only relate to the items tested. This report may not be used by the customer to claim product endorsement by NVLAP or any other U.S. Government Agency.
Laboratory results represent the analysis of samples as submitted by the customer. Information regarding sample location, description, area, volume, etc., was provided by the customer. Asbestos Identification Laboratory is not responsible for sample collection activities or analytical method limitations. Unless notified in writing to return samples, Asbestos Identification Laboratory discards customer samples after 30 days. Samples containing subsamples or layers will be analyzed separately when applicable. Reports are kept at Asbestos Identification Laboratory for three years. This report shall not be reproduced, except in full, without the written consent of Asbestos Identification Laboratory.

Re: Loam/Topsoil and Subsoil Sampling, Laboratory Analysis and LSP Opinion Letter
Charles C. Cashman Elementary School
193 Lions Mouth Road
Amesbury, Massachusetts 01913
***ECMS* Project No. 1009.073**

Dear Ms. Low:

Pursuant to your request, *Environmental & Construction Management Services, Inc. (ECMS)* has completed the collection of loam/topsoil and subsoils samples from representative areas proximate to the Cashman School and from the field adjacent to the school for laboratory analysis for potential oil and/or hazardous material (OHM) prior to proposed site construction activities. Refer to Figure 1, Site Locus/Location Plan for the general location of the Site.

On July 9, 2020, *ECMS* personnel collected fifteen (15) surficial loam/topsoil and two (2) subsoil samples. The samples were collected from areas identified by *DiNisco Design (DiNisco)* in Proposed Topsoil Removal Limit Plan (Markup) dated July 6, 2020. Refer to Figure 2, Soil Sample Location Plan for the location of the soil samples. Loam/topsoil samples were collected below the grass surface from 2 to 6 inches below surface grade and subsurface soil samples were collected approximately 2 feet below grade at refusal.

All soil samples were analyzed under chain of custody (COC) by Massachusetts approved laboratory *Eurofins Spectrum Analytical* of Agawam, Massachusetts for Comm97 Soil Laboratory Analysis plus additional analysis for Mass Reclamation Facilities which includes: Volatile Organic Compounds (VOCs) by Environmental Protection Agency (EPA) Method 8260, Semi Volatile Organic Compounds (SVOCs) by EPA Method 8270, Polychlorinated Biphenyls (PCBs) by EPA Method 8082 and Total Petroleum Hydrocarbons (TPH) by Gas Chromatograph (GC), MassDEP 14 Metals, Herbicides and Pesticides by EPA Method 8151A and Method 8151B. Additionally, all soil samples were further characterized by the analysis of pH, flashpoint and reactivity (cyanide and sulfide).

In Massachusetts, the regulatory program that concerns releases of OHM to the environment is the Massachusetts Contingency Plan (MCP) 310 CMR 40.0000. This program is implemented by the Massachusetts Department of Environmental Protection (the "MassDEP") and includes specific

provisions regarding releases of oil and/or hazardous material (OHM) to the environment that must be reported to the MassDEP.

Soil Sampling Results

No concentrations of OHM in any of the fifteen (15) loam/topsoil and/or two (2) subsoil samples analyzed were detected above their applicable reportable concentration RCS-1 specified in Massachusetts Oil and Hazardous Materials List (MOHML) 310 CMR 40.1600 and 310 CMR 40.0300 **with the exception of arsenic. Concentrations of arsenic in all 17 soil samples submitted were detected above their RCS-1 of 20 milligrams per kilogram (mg/kg)**. The concentrations of arsenic ranged between 20.5 mg/kg and 82.3 mg/kg with an RCS-1 of 20 mg/kg. No concentrations of arsenic were detected above their applicable upper concentration limit (UCL) of 500 mg/kg. A copy of the laboratory results and their respective MCP RCS-1 reporting concentrations (RCs) are presented in Tables 1 through 4.

In addition, several SVOC compounds were above their applicable MCP RCS-1 310 CMR 40.0300 and 40.1600 criteria. The MDLs for these compounds are generally less than one order magnitude over their respective MDL and the past use of the site does not include the past use, storage of application of any OHM and therefore these compounds are not considered to be compounds of concern (COC).

Summary and Conclusions

In accordance with the Massachusetts Contingency Plan (MCP) 310 CMR 40.0361: Reportable Concentrations of Oil and Hazardous Material in Soil:

> (1) For the purpose of determining whether a notification obligation exists under 310 CMR 40.0315, measured concentrations of any oil or hazardous material listed at 310 CMR 40.1600 shall be compared to the Reportable Concentration value in the reporting category that best characterizes the current use of the site under evaluation, as described below:
>
> > (a) Reporting Category RCS-1. Reporting category RCS-1 shall be applied to all soil samples obtained at or within 500 feet of a residential dwelling, a residentially-zoned property, school, playground, recreational area or park.

The **detection of arsenic collected on July 9, 2020 in the site soils at concentrations exceeding their applicable RCS-1 triggers a 120-day notification requirement to the MassDEP under MCP 310 CMR 40.0315: Releases Which Require Notification Within 120 Days**.

Additionally, **since five (5) of the 17 soil samples exceeded a concentration of arsenic over 40 mg/kg the criteria for a release that could pose an Imminent Hazard to human health** in accordance with MCP 310 CMR 40.0321(2) which is "a release to the environment indicated by the measurement of concentrations of hazardous material, equal to or greater than any of the following concentrations at the ground surface or within a depth of twelve (12) inches below the

ground surface, at any location within 500 feet of a residential dwelling, school, playground, recreation area or park, unless access by children is controlled or prevented by means of bituminous pavement, concrete, fence, or other physical barrier". **A release that <u>could pose</u> an Imminent Hazard to human health requires a "Two Hour" release notification obligation to the MassDEP**.

<u>Recommendations</u>

At this time, due to the limited time to properly evaluate whether the detection of the concentrations of arsenic from the soil results from the July 9, 2020 soil precharacterization sampling prior to construction are naturally occurring as believed, ***ECMS*** **recommends that the MassDEP be notified of a release that <u>could pose</u> an Imminent Hazard to human health requires a "Two Hour" release notification obligation.**

As stated in MCP 310 CMR 40.0321(3) Notwithstanding the provisions of 310 CMR 40.0321(2) and 40.0321(3), a person required to notify under 310 CMR 40.0331 may demonstrate to the Department by a preponderance of the evidence that release or site conditions specified in 310 CMR 40.0321(2) and/or (3) do not constitute an actual Imminent Hazard to human health, in conformance with the Imminent Hazard Evaluation process described in 310 CMR 40.0426, and in consideration of the site-specific factors and the risk assessment and risk management criteria contained in 310 CMR 40.0950. No such demonstration, however, shall relieve any person of the obligation to notify the Department of a release or threat of release under the provisions of 310 CMR 40.0311 or 40.0312.

ECMS recommends that an **Imminent Hazard Evaluation** be completed to ensure that an Imminent Hazard does not exist.

ECMS also recommends that after MassDEP release notification that an evaluation be conducted to determine if a **Release Notification Retraction** under MCP 310 CMR 40.0335(1)(c), this release notification is being retracted on the basis that the subject release did not meet one or more of the sets of notification criteria specified in 310 CMR 40.0300. Specifically, releases of arsenic do not require notification pursuant to 310 CMR 40.0317(22) if they are in areas that are documented to have elevated arsenic measured in soil or groundwater that:

- is consistently present in the environment at and in the vicinity of the sampling location;
- is solely attributable to natural geologic or ecologic conditions; and
- has not been mobilized or transferred to another environmental medium or increased in concentration in an environmental medium as a result of anthropogenic activities.

Preliminary research indicates that the City of Amesbury lies within an area of Massachusetts that has been identified in studies by the United States Geological Survey (USGS) as being underlain by bedrock units, particularly the Merrimack and Nashoba formations, containing elevated arsenic concentrations (see *Arsenic and Uranium in Water from Private Well Completed in Bedrock of East-Central Massachusetts– Concentrations, Correlations with Bedrock Units, and Estimated Probability Maps*, John A. Colman, USGS, Scientific Investigations Report 2011-5013). Refer to https://pubs.usgs.gov/sir/2011/5013/.

Review of the test pits data completed by GZA as part of the geotechnical investigation indicates the presence of fill. Before any conclusion can be made to whether the detection of elevated arsenic in the site's soils is applicable for retraction, the nature and the source of the fill should be evaluated. Refer to Figure 3 Soil Test Location Plan dated December 23, 2019.

ECMS recommends that additional soil samples be collected at depths (greater than could be achieved during the sampling on July 9, 2020) as well as additional samples from areas further away from the ball fields where the majority of the July 9, 2020 sampling was conducted and analyzed for arsenic. As some of the site has been filled, additional research on the source of this fill will be conducted to determine its origin whether it was reworked from the site or imported, if possible.

Should you have any further questions or comments, please do not hesitate to contact us at (617) 338-2121.

Sincerely,

*For **Environmental & Construction Management Services, Inc.** by*

< indicates less than the respective method detection limit.
mg/kg = milligrams per kilogram
µg/kg = micrograms per kilogram
Bolfaced type indicates an exceedance.

< indicates less than the respective method detection limit.
mg/kg = milligrams per kilogram
µg/kg = micrograms per kilogram
Bolfaced type indicates an exceedance.
Pursuant to MCP 310 CMR 40.0975(6)(a-c): MCP Method 1 Soil Standards, and Massachusetts Oil and Hazrdous Materials List (MOHML) revised (effective) February 14, 2008

Environmental & Construction Management Services, Inc.

Laboratory Report
SC58794

ECMS, Inc.
639 Granite Street, Suite 407
Braintree, MA 02184
Attn: Kevin Kavanaugh

Project: Cashman School - Amesbury, MA
Project #: 1009.073

I attest that the information contained within the report has been reviewed for accuracy and checked against the quality control requirements for each method. These results relate only to the sample(s) as received.
All applicable NELAC requirements have been met.

Massachusetts # RI907
New York # 11393
Rhode Island # LAI00368
USDA # P330-20-00109

Authorized by:

Agnes Huntley
Project Manager

Eurofins Environment Testing New England holds primary NELAC certification in the State of New York for the analytes as indicated with an X in the "Cert." column within this report. Please note that the State of New York does not offer certification for all analytes. Please refer to our website for specific certification holdings in each state.
Please note that this report contains 175 pages of analytical data plus Chain of Custody document(s). When the Laboratory Report is indicated as revised, this report supersedes any previously dated reports for the laboratory ID(s) referenced above. Where this report identifies subcontracted analyses, copies of the subcontractor's test report are available upon request. This report may not be reproduced, except in full, without written approval from Eurofins Environment Testing New England.

Eurofins Environment Testing New England is a NELAC accredited laboratory organization and meets NELAC testing standards. Use of the NELAC logo however does not insure that Eurofins Environment Testing New England is currently accredited for the specific method or analyte indicated. Please refer to our "Quality" web page at www.eurofinsus.com/Spectrum for a full listing of our current certifications and fields of accreditation.

Please contact the Laboratory or Technical Director at 413-789-9018 with any questions regarding the data contained in this laboratory report.

Sample Summary

Work Order: SC58794

Project: Cashman School - Amesbury, MA

MassDEP Analytical Protocol Certification Form

Laboratory Name: Eurofins Spectrum Analytical, Inc. **Project #:** 1009.073

Project Location: Cashman School - Amesbury, MA **RTN:**

This form provides certifications for the following data set: SC58794-01 through SC58794-17

Matrices: Soil

CAM Protocol

✓ 8260 VOC CAM II A	✓ 7470/7471 Hg CAM III B	MassDEP VPH CAM IV A	✓ 8081 Pesticides CAM V B	7196 Hex Cr CAM VI B	MassDEP APH CAM IX A
✓ 8270 SVOC CAM II B	7010 Metals CAM III C	MassDEP EPH CAM IV B	✓ 8151 Herbicides CAM V C	8330 Explosives CAM VIII A	TO-15 VOC CAM IX B
✓ 6010 Metals CAM III A	6020 Metals CAM III D	✓ 8082 PCB CAM V A	9012 Total Cyanide/PAC CAM VI A	9014 Total Cyanide/PAC CAM VI A	6860 Perchlorate CAM VIII B

Affirmative responses to questions A through F are required for "Presumptive Certainty" status

A	Were all samples received in a condition consistent with those described on the Chain of Custody, properly preserved (including temperature) in the field or laboratory, and prepared/analyzed within method holding times?	Yes ✓ No
B	Were the analytical method(s) and all associated QC requirements specified in the selected CAM protocol(s) followed?	✓ Yes No
C	Were all required corrective actions and analytical response actions specified in the selected CAM protocol(s) implemented for all identified performance standard non-conformances?	✓ Yes No
D	Does the laboratory report comply with all the reporting requirements specified in CAM VII A, "Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data"?	✓ Yes No
E	a. VPH, EPH, and APH Methods only: Was each method conducted without significant modification(s)? b. APH and TO-15 Methods only: Was the complete analyte list reported for each method?	Yes No Yes No
F	Were all applicable CAM protocol QC and performance standard non-conformances identified and evaluated in a laboratory narrative (including all "No" responses to questions A through E)?	✓ Yes No

Responses to questions G, H and I below are required for "Presumptive Certainty" status

G	Were the reporting limits at or below all CAM reporting limits specified in the selected CAM protocol(s)?	✓ Yes No

***Data User Note:* Data that achieve "Presumptive Certainty" status may not necessarily meet the data usability and representativeness requirements described in 310 CMR 40. 1056 (2)(k) and WSC-07-350.**

H	Were all QC performance standards specified in the CAM protocol(s) achieved?	Yes ✓ No
I	Were results reported for the complete analyte list specified in the selected CAM protocol(s)?	✓ Yes No

All negative responses are addressed in a case narrative on the cover page of this report.

I, the undersigned, attest under the pains and penalties of perjury that, based upon my personal inquiry of those responsible for obtaining the information, the material contained in this analytical report is, to the best of my knowledge and belief, accurate and complete.

Dawn E. Wojcik

Dawn E. Wojcik
Laboratory Director
Date: 7/17/2020

CASE NARRATIVE:

Data has been reported to the RDL. This report excludes estimated concentrations detected below the RDL and above the MDL (J-Flag).

All non-detects and all results below the reporting limit are reported as "<" (less than) the reporting limit in this report.

The samples were received 2.3 degrees Celsius, please refer to the Chain of Custody for details specific to temperature upon receipt. An infrared thermometer with a tolerance of +/- 1.0 degrees Celsius was used immediately upon receipt of the samples.

If a Matrix Spike (MS), Matrix Spike Duplicate (MSD) or Duplicate (DUP) was not requested on the Chain of Custody, method criteria may have been fulfilled with a source sample not of this Sample Delivery Group. If method or program required MS/MSD/Dup were not performed, sufficient sample was not provided to the laboratory.

MADEP has published a list of analytical methods (CAM) which provides a series of recommended protocols for the acquisition, analysis and reporting of analytical data in support of MCP decisions. "Presumptive Certainty" can be established only for those methods published by the MADEP in the MCP CAM. The compounds and/or elements reported were specifically requested by the client on the Chain of Custody and in some cases may not include the full analyte list as defined in the method. Regulatory limits may not be achieved if specific method and/or technique was not requested on the Chain of Custody.

According to WSC-CAM 5/2009 Rev.1, Table 11 A-1, recovery for some VOC analytes have been deemed potentially difficult. Although they may still be within the recommended recovery range, a range has been set based on historical control limits.

Some target analytes which are not listed as exceptions in the Summary of CAM Reporting Limits may exceed the recommended RL based on sample initial volume or weight provided, % moisture content, or responsiveness of a particular analyte to purge and trap instrumentation.

All VOC soils samples submitted and analyzed in methanol will have a minimum dilution factor of 50. This is the minimum amount of solvent allowed on the instrumentation without causing interference. Soils are run on a manual load instrument. 100ug of sample (MEOH) is spiked into 5ml DI water along with the surrogate and added directly onto the instrument. Additional dilution factors may be required to keep analyte concentration within instrument calibration range.

Method SW846 5035A is designed to use on samples containing low levels of VOCs, ranging from 0.5 to 200 ug/Kg. Target analytes that are less responsive to purge and trap may be present at concentrations over 200ug/Kg but may not be reportable in the methanol preserved vial (SW846 5030). This is the result of the inherent dilution factor required for the methanol preservation.

Analyses for Total Hardness, pH, and Total Residual Chlorine fall under the state of Pennsylvania code Chapter 252.6 accreditation by rule.

Reactivity (40 CFR 261.23) Case Narrative:

These samples do not exhibit the characteristics of reactivity as defined in 40 CFR 261.23, sections (1), (2) and (4); however, Eurofins Spectrum Analytical, Inc. does not test for detonation, explosive reaction or potential, or forbidden explosives as defined in 40 CFR 261.23, sections (3), (6), (7) and (8).

Reactive sulfide and cyanide are tested at a pH of 2 and not tested at all conditions between pH 2 and12.5 as stated in 40 CFR 261.23, section (5); thus reactive cyanide and sulfide results as reported in this document can not be used to support the nonreactive properties of these samples.

The responsibility falls on the generator to use knowledge of the waste to determine if the waste meets or does not meet the descriptive, prose definition of reactivity.

See below for any non-conformances and issues relating to quality control samples and/or sample analysis/matrix.

SW8151A

Laboratory Control Samples:

537320A BSD

SW8151A

Laboratory Control Samples:

537320A BSD

Dinoseb RPD 64.3% (20%) is outside individual acceptance criteria.

CG33195-LCS

This parameter is outside laboratory rpd specified recovery limits.

Samples:

SC58794-05 *SSS-12*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-06 *SSS-13*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-07 *SSS-14*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SW846 8081B

Samples:

SC58794-08 *SSS-16*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-09 *SSS-17*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-10 *SSS-3*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-11 *SSS-4*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-12 *SSS-5*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-13 *SSS-6*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-14 *SSS-7*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-15 *SSS-8*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-16 *SSS-9*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-17 *SSS-15*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

N-Nitrosodimethylamine RPD 32% (30%) is outside individual acceptance criteria.

Pyridine RPD 33% (30%) is outside individual acceptance criteria.

2001083-BSD1

Analyte is out of acceptance range in the QC spike but the total number of out of range analytes is within overall method criteria.

N-Nitrosodimethylamine
Pyridine

SW846 8270D

Spikes:

2001083-MS1 *Source: SC58794-01*

The spike recovery for this QC sample is outside the established control limits. The sample results for the QC batch were accepted based on LCS/LCSD or SRM recoveries within the control limits.

2,4-Dinitrophenol
Aniline
Benzidine
Benzoic acid

2001083-MSD1 *Source: SC58794-01*

The spike recovery for this QC sample is outside the established control limits. The sample results for the QC batch were accepted based on LCS/LCSD or SRM recoveries within the control limits.

Aniline
Benzidine

Sample Acceptance Check Form

Client:	ECMS, Inc.
Project:	Cashman School - Amesbury, MA / 1009.073
Work Order:	SC58794
Sample(s) received on:	7/10/2020

The following outlines the condition of samples for the attached Chain of Custody upon receipt.

	Yes	No	N/A
Were custody seals present?	☐	☑	☐
Were custody seals intact?	☐	☐	☑
Were samples received at a temperature of ≤ 6°C?	☑	☐	☐
Were samples cooled on ice upon transfer to laboratory representative?	☑	☐	☐
Were sample containers received intact?	☑	☐	☐
Were samples properly labeled (labels affixed to sample containers and include sample ID, site location, and/or project number and the collection date)?	☑	☐	☐
Were samples accompanied by a Chain of Custody document?	☑	☐	☐
Does Chain of Custody document include proper, full, and complete documentation, which shall include sample ID, site location, and/or project number, date and time of collection, collector's name, preservation type, sample matrix and any special remarks concerning the sample?	☐	☑	☐
Did sample container labels agree with Chain of Custody document?	☑	☐	☐
Were samples received within method-specific holding times?	☑	☐	☐

Analyte(s)	Column	% Breakdown	Limit

Notes and Definitions

D	Data reported from a dilution
QC2	Analyte out of acceptance range in QC spike but no reportable concentration present in sample.
QC6	Analyte is out of acceptance range in the QC spike but the total number of out of range analytes is within overall method criteria.
QM7	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QM8	The spike recovery exceeded the QC control limits for the MS and/or MSD. The batch was accepted based upon acceptable PS and /or LCS recovery.
QM9	The spike recovery for this QC sample is outside the established control limits. The sample results for the QC batch were accepted based on LCS/LCSD or SRM recoveries within the control limits.
QR6	The RPD exceeded the QC control limits; however precision is demonstrated with acceptable RPD values for MS/MSD.
r	This parameter is outside laboratory rpd specified recovery limits.
Z-2	The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.
dry	Sample results reported on a dry weight basis
NR	Not Reported
RPD	Relative Percent Difference
[2C]	Indicates concentration was reported from the secondary, confirmation column.
J	Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
pH	The method for pH does not stipulate a specific holding time other than to state that the samples should be analyzed as soon as possible. For aqueous samples the 40 CFR 136 specifies a holding time of 15 minutes from sampling to analysis. Therefore all aqueous pH samples not analyzed in the field are considered out of hold time at the time of sample receipt. All soil samples are analyzed as soon as possible after sample receipt.

Interpretation of Total Petroleum Hydrocarbon Report

Petroleum identification is determined by comparing the GC fingerprint obtained from the sample with a library of GC fingerprints obtained from analyses of various petroleum products. Possible match categories are as follows:

Gasoline - includes regular, unleaded, premium, etc.
Fuel Oil #2 - includes home heating oil, #2 fuel oil, and diesel
Fuel Oil #4 - includes #4 fuel oil
Fuel Oil #6 - includes #6 fuel oil and bunker "C" oil
Motor Oil - includes virgin and waste automobile oil
Ligroin - includes mineral spirits, petroleum naphtha, vm&p naphtha
Aviation Fuel - includes kerosene, Jet A and JP-4
Other Oil - includes lubricating and cutting oil, and silicon oil

At times, the unidentified petroleum product is quantified using a calibration that most closely approximates the distribution of compounds in the sample. When this occurs, the result is qualified as Calculated as.

Laboratory Control Sample (LCS): A known matrix spiked with compound(s) representative of the target analytes, which is used to document laboratory performance.

Matrix Duplicate: An intra-laboratory split sample which is used to document the precision of a method in a given sample matrix.

Matrix Spike: An aliquot of a sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

Method Blank: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting from the analytical process.

Method Detection Limit (MDL): The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte.

Reportable Detection Limit (RDL): The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. For many analytes the RDL analyte concentration is selected as the lowest non-zero standard in the calibration curve. While the RDL is approximately 5 to 10 times the MDL, the RDL for each sample takes into account the sample volume/weight, extract/digestate volume, cleanup procedures and, if applicable, dry weight correction. Sample RDLs are highly matrix-dependent.

Surrogate: An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. These compounds are spiked into all blanks, standards, and samples prior to analysis. Percent recoveries are calculated for each surrogate.

Continuing Calibration Verification: The calibration relationship established during the initial calibration must be verified at periodic intervals. Concentrations, intervals, and criteria are method specific.

APPENDIX B

QUALIFICATIONS/LIMITATIONS

QUALIFICATIONS/LIMITATIONS

Environmental & Construction Management Services, Inc. (ECMS) professional services have been performed, our findings obtained, and our recommendations prepared in accordance with customary principles and practices in the fields of environmental science and engineering. This warranty is in lieu of all other warranties either expressed or implied. *ECMS* is not responsible for the independent conclusions, opinions or recommq1endations made by others based on the records review, site inspection, field exploration, and laboratory test data presented in this report.

Factual information regarding on-site business operations, conditions, and historical data provided to *ECMS* is assumed to be correct and complete. *ECMS* assumes no responsibility for hidden or latent conditions or misrepresentation by the property owner, its representatives, public information officials or any authority consulted in connection with the compilation of this report.

The findings set forth in the attached Site assessment report are strictly limited in time and scope to the date of the evaluation(s). The conclusions presented in the Report are based solely on the services described therein, and not on scientific tasks or procedures beyond the scope of agreed upon services or the time and budgeting restraints imposed by the client.

The purpose of this report was to assess the physical characteristics of the subject Site with respect to the presence in the environment of hazardous material or oil. No specific attempt was made to check on the compliance of present or past owners or operators or of the Site with Federal, State or local laws and regulations, environmental, or otherwise.

Partial findings of this investigation are based on data provided by others. No warranty is expressed or implied with the usage of such data. Much of the information provided in this report is based upon personal interviews and research of all available documents, records and maps held by the appropriate government and private agencies. This is subject to the limitations of historical documentation, availability and accuracy of pertinent records, and the personal recollection of those persons contacted by *ECMS* personnel. *ECMS* is not a professional title insurance firm and makes no guarantee, explicit or implied that the listing, which was reviewed, represented a comprehensive delineation of past Site ownership or tenancy for legal purposes.

Observations were made of the Site and of structures on the Site as indicated within the Report. Where access to portions of the Site or to structures on the Site was unavailable or limited, *ECMS* is unable to render an opinion as to the presence of hazardous material or oil, or to the presence if indirect evidence relating to hazardous material or oil, in that portion of the Site or structure. In addition, *ECMS* renders no opinion as to the presence of hazardous material or oil, where direct observation of the interior walls, floor, or ceiling of a structure on a Site was obstructed by objects or coverings on or over these surfaces.

The initial site investigation took into account the natural and man-made features of the Site, including any unusual or suspect phenomenon. These factors combined with the Site's geology,

hydrology, topography, and past and present land uses served as a basis for choosing a methodology and location for subsurface exploration as well as ground water and subsurface sampling, if done. The subsurface data, if provided, is meant as a representative overview of the Site.

The conclusions and recommendations contained in this report may be based in part upon various types of chemical data and are contingent upon their validity. As indicated within the Report, some of these data are preliminary "screening" level data, and should be confirmed with quantitative analyses if more specific information is necessary. It should be noted that variations in the types and concentrations of contaminants and variations in their flow paths may occur due to seasonal water table fluctuations, past disposal practices, the passage of time, and other factors. Should additional data or variations of current data become available in the future, these data should be reviewed, and the conclusions and recommendations presented herein modified accordingly.

Chemical analyses may have been performed for specific parameters during the course of this Site assessment, as described in the text. However, it should be noted that additional chemical constituents not searched for during the current study might be present in soil and/or ground water at the Site.

1.0 INTRODUCTION

An Imminent Hazard Evaluation (IHE) is presented in this report for the Cashman Elementary School, located at 193 Lions Mouth Road in Amesbury, Massachusetts [Release Tracking Number (RTN) 3-31833]. This IHE was performed in accordance with requirements of the Massachusetts Contingency Plan (MCP, 310 CMR 40.0000) and other relevant guidance developed by the Massachusetts Department of Environmental Protection (MassDEP).

2.0 PROPERTY DESCRIPTION

2.1 Location and Legal Description of the Site

The Site is an irregularly-shaped 35.32-acre parcel of land located at 193 Lions Mouth Road in Amesbury, Essex County, Massachusetts 01913. According to the City of Amesbury Assessor, the property is listed as parcel 50/6. The Site is occupied by the Charles C. Cashman Elementary School and associated athletic fields, playground, parking lots and landscaped areas. Refer to Figure 2 entitled Lot Location Plan.

The Site is depicted on the 7.5 x 15-minute U.S.G.S. topographic quadrangle for Newburyport, Massachusetts dated 1987. The Universal Transverse Mercator (UTM) coordinates of the Site within zone 19 are approximately 4,746,558 meters north latitude and 340,818.9 meters east longitude or 42° 51' 26.06'' north latitude and 70° 56' 54.07'' west longitude. Elevation at the site is approximately 105 feet above mean sea level (amsl). Figure 1 includes both a Site Locus Plan and a Street Location Map of the Site. The Site and surrounding properties are shown on Figure 2, Lot Location Plan attached to this report.

2.2 Site and Vicinity Characteristics

The Site is currently occupied by the City of Amesbury Cashman Elementary School housing grades Pre-kindergarten through 4 (approximately 458 children). The Site is located within OSC – Open Space Conservancy. The school building is surrounded by a driveway and associated paved parking lots, a playground area and grass athletic field. Woodsom Farm to the west, and is accessed from Lions Mouth Road to the South. The north edge of the site is steeply sloping forested hill with an intermittent steam at the base. The Site is surrounded with pockets of densely settled residential neighborhoods.

No existing commercial printing facilities, gasoline filling/service stations, industrial properties or fuel depots were identified in the immediate vicinity of the

subject site. The past uses of these surrounding properties do not pose recognized environmental concerns to the Site.

2.3 Descriptions of Structures, Roads, Other Improvements on the Site

The 2-story school building is 61,472 gross square feet (GSF). The building is constructed of masonry block with brick veneer on slab on grade construction.

Assessor Office records indicate that the main Site building construction was completed in 1975. The school building is currently heated by natural gas and heated through forced air ducts. The roof is asphalt and on the roof are several HVAC units. Records indicate, the building is and always has been heated by natural gas. A copy of the Assessor Property Card is attached as Appendix D.

The nearest surface water bodies to the Site is Lake Gardner that is located approximately 2,500 feet to the north-northeast. According to the City of Amesbury Health Department, there are no know public or private potable water supply wells in the vicinity of the Site.

The City of Amesbury obtains its drinking water from its watershed area that encompasses about 55 square miles; most of which reside in New Hampshire. Tuxbury Pond feeds the Powow River, which the treatment plant draws from. Lake Attitash and Meadowbrook also supplement the water source seasonally and in times of drought. All of Amesbury's wastewater empties into their municipal sewer system. The wastewater treatment facility is located at 19 Merrimac Street.

The site is currently supplied with natural gas and serviced by the municipal water and sewer systems.

The existing school building has a sewage ejector system that was observed along the entrance driveway area south of the school.

2.4 Site Ownership

According to City of Amesbury Assessor's records, the subject site is owned by the City of Amesbury as of December 30, 1971 (Book 5833, Page 124).

A Title Search was not supplied to *ECMS*, and therefore additional ownership information was not available.

2.5 Current Uses of the Site

The Site is currently utilized as the City of Amesbury Cashman Elementary School for grades Pre-K through Grade 4.

2.6 Current Uses of Surrounding Properties

The Site is located within an area primarily used for single-family residential homes, farmland and undeveloped wooded vacant land. There were no visual indications observed during *ECMS* visual inspection of nearby or abutting properties of conditions that would indicate a release or threat of release of oil and/or hazardous substances on, at, in, or to the Site.

2.7 Past Uses of the Site and Vicinity

Historical information was obtained from a review of the historical topographs (1932, 1934, 1943, 1944, 1947, 1950, 1956, 1952, 1968, 1973, 1979, 1971, 1985, 1987 and 2012), historical aerial photos (1953, 1960, 1966, 1973, 1978, 1986, 1992, 1998, 2006, 2009, 2012 and 2016), City Directory (1961, 1965, 1968, 1973, 1977, 1982, 1987, 1992, 1995, 2000, 2005, 2010 and 2014). Refer to Appendix A for copies of the above historic documents.

The historical aerial photo from 1978 shows the school building. Prior to construction of the school building, the Site land area was undeveloped and appears to be farmland as depicted in the aerial photographs from 1953 through 1973.

Properties surrounding the Site to the north, south, east and west were developed with sporadic residential properties and some may have been farmland.

The past uses of these surrounding properties do not pose recognized environmental concerns to the Site.

3.0 EVALUATION OF IMMINENT HAZARDS

The purpose of an IHE is to evaluate whether an immediate response action (IRA) is needed to control or reduce short-term exposure to a release of oil and/or hazardous material while comprehensive investigations and response actions are being evaluated. The need for comprehensive response actions (i.e., the ultimate actions for the release) is determined (in part) by a Risk Characterization, which is performed after all site investigations are completed.

For this IHE *ECMS* engaged *Mr. Peter LaGoy of LaGoy Risk Analysis, Inc. (LaGoy)* in Hopkinton, Massachusetts as a professional risk assessor to evaluate the recently obtained soil sample analytical results for samples collected on July 9, 2020. Excerpts from the *LaGoy* "Evaluation of Soil Data from the Charles C. Cashman Elementary School, 193 Lions Mouth Road, Amesbury, Massachusetts dated July 27, 2020" and attached as Appendix A are included in the ECMS IHE presented herein.

The MCP requires that IHEs be conducted separately for human health, the environment, and safety. These evaluations are presented in the following subsections.

3.1 Human Health Imminent Hazard Evaluation

According to 310 CMR 40.0321(1)(d) and (f), a release of oil and/or hazardous material that poses a significant risk of harm to human health when present even for a short period of time, or a release to the environment that produces readily apparent effects to human health, including respiratory distress or dermal irritation, constitutes an imminent hazard. A short period of time is defined as five (5) years, unless site circumstances indicate that a shorter period of time is appropriate [40 CMR 40.0953(1)]. Human health IHEs consider actual or likely exposures of humans under current site conditions and uses (§40.0953). IHEs are expected to be conservative [(§40.0953(7)], to consider "hot spots" [§40.0953(4)], to focus on soil between 0 and 1 foot in depth [§40.0953(2)], and can focus on the constituents that are likely to dominate the IHE [§40.0953(5)].

The MCP and MassDEP guidance specify criteria for identifying the presence of an imminent hazard to human health. For non-carcinogenic constituents, the Hazard Index (HI) defining an imminent hazard is greater than:

- one (1) for oil or hazardous materials that have the potential to cause serious effects (including but not limited to lethal, developmental, or neurological effects) following short-term exposures; or
- ten (10) for all other oil or hazardous materials [MCP 310 CMR 40.0955(2)(c)(1)].

For carcinogenic constituents, the excess lifetime cancer risk defining an imminent hazard is:

- greater than a risk of 1 in 100,000 (denoted as 1x10-5) for a short exposure period (e.g., a 5-year exposure period) [MCP 310 CMR 40.0995(2)(b)]; and,
- greater than a risk of 1 in 10,000 (denoted as 1x10-4) over a long exposure period (MassDEP 1995).

3.1.1 Compounds of Concern (COCs)

The recent subject sampling event consisted of collecting 15 soil samples from beneath the grass (2-6 inches in depth), and two additional samples of slightly deeper soil (2 feet in depth). Soil was analyzed for the presence of metals, total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs, including the polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), and pesticides and herbicides. The results of the sampling are presented in Table 1 of Appendix A.

Only arsenic was present at a concentration above a reportable concentration. TPH was also detected in most samples (concentrations around 100 mg/kg) but could be present as a result of it use as a binder (waxes) in various lawn care products. Maximum metal concentrations were compared with expected concentrations in soil in Massachusetts (Table 2 of Appendix A), and chromium, nickel, and vanadium were present at levels above expected background. The four metals, arsenic, chromium, nickel, and vanadium will be considered in the imminent hazard calculations.

3.1.2 Receptors and Exposure Pathways

Potentially exposed humans at the site under current site use include children including students, non-student users of the playing fields and adults including commercial (school) workers, construction/utility workers (potentially), and visitors (including parents attending sporting event games). Because intermittently exposed individuals, such visitors, will be exposed to a lesser extent (shorter duration of exposure and/or less frequently) than students, non-student users of the playing field, and school workers, visitor exposure is not assessed. School worker exposure conservatively represents potential visitor exposure.

3.1.3 Exposure Point Concentrations

Students, school workers, and non-student users of the playing fields are assumed exposed only to shallow soil (depths of 0-1 foot), per MCP guidance for performing IHEs. The soil exposure point concentration (EPC) for arsenic in soil applied to the IHE is the 95th percentile upper confidence limit (95% UCL) of the mean concentration of arsenic in shallow soil.

Construction/utility workers are assumed exposed to both shallow and deeper soil, consistent with the type of activities (e.g., soil excavation) potentially performed. The soil EPC for arsenic is the 95% UCL of the mean concentration of arsenic in shallow and deeper soil.

Maximum concentrations were used as EPCs for chromium, nickel, and vanadium. For this site, concentrations of arsenic in shallow soil were detected in a narrow range (21.9 mg/kg – 82.3 mg/kg), and the 95% Upper Confidence Limit (UCL) calculated using the EPA's ProUCL model version 5.1 was used to calculate an EPC of 46.4 mg/kg for arsenic, based on a normal distribution of data and the Student t-test.

3.1.4 Quantitative Exposure Assessment

In general, individuals are exposed to materials released into the environment in varying quantities and proportions via a wide variety of possible exposure routes. The actual amount of material to which an individual is exposed depends on the

individual's frequency, extent, and duration of exposure, which in turn depend on many factors, including location of residence, age, body weight, sex, and activity patterns. Patterns of exposure are highly variable among individuals. This large potential variation in exposure to environmental conditions implies that a certain amount of uncertainty is inherent in risk assessment. This exposure assessment uses standard approaches and assumptions that are designed to be health protective, i.e., they are designed to produce estimates of exposure that overestimate, rather than underestimate, actual exposure and risk.

The purpose of a quantitative exposure assessment is to estimate the Chronic Daily Intake (CDI) of each contaminant of concern by an individual for each exposure route. For carcinogens, the CDI is averaged over the full lifetime (by convention, assumed to be 70 years; MassDEP 2008) and is termed the Lifetime Average Daily Dose or LADD for oral and dermal exposures. For noncarcinogens, the dose is only averaged over the period of exposure and is noted as the Average Daily Dose or ADD for oral and dermal exposure.

Soil Exposure – Children

Children are at school 180 days per year, and can also use the school facilities during the summer (roughly 70 days; end of June to end of August) but will use the outdoor play fields for only a fraction of that time and for short periods. Very young children (less than 2 year of age) are considered unlikely to be present on a regular basis. For the purposes of this assessment, contact by children is assumed for 109 days per year, which is the outdoor time assumed by MassDEP (1994) in initially establishing the S-1 soil standards. Exposure for a third of a year to a single outdoor play area is unlikely but provides a conservative estimate of exposure potential. People who contact soil may be exposed to constituents present in the soil by direct contact and subsequent ingestion of contaminated soil or by dermal absorption of constituents in soils adhering to the skin. Younger children are of greatest concern for soil contact, and therefore, assessment of exposure to younger children can be used to conservatively evaluate the potential for risks to older students. For this IHE, children are estimated to weigh an average of 15 kg (33 lbs.) based on the median weight for 5-year-old children (the youngest age likely to be regularly out on their own) determined in the NHANES II study for the US population in 1980 (MassDEP 1994). USEPA has reviewed more current data and has indicated average weights for humans have increased since that study.

Soil Ingestion: Children in regular contact with site soil are estimated to ingest 100 mg of soil per day (MassDEP 2002). All constituents in soil are assumed to be as available from the soil as from the media used in the toxicity studies and, consequently, a relative absorption factor or RAF of one is used for these constituents. Using this assumption and the others noted above, the ADD and LADD for soil ingestion by children can be estimated using the formula:

$$ADD/LADD = \frac{CS \times IR \times RAF \times EF \times ED}{BW \times 106\ (mg/kg) \times AT}$$

Where:

ADD = Average daily intake of the constituent (mg/kg/day),
LADD= Lifetime average daily dose (mg/kg/day),
CS = Constituent concentration in soil (mg/kg),
IR = Soil ingestion rate (100 mg/day; MassDEP 1995),
RAF = Relative absorption factor (1),
EF = Frequency of ingestion (109 days/year; MassDEP 1995),
ED = Exposure Duration (5 years; MassDEP 1995),
BW = Body weight (15 kg; EPA 1989), and
AT = Averaging Time (365 days x 5 yrs. (ADD) or 365 x 70 (LADD) days).

The calculated ADD for children exposed to lead detected in soil at the property based on this equation is provided in Table 3 for ingestion exposure to the soil at the school.

Dermal Contact: Dermal exposure to constituents in soil can occur through direct physical contact with soil. The same assumptions as for soil ingestion are used, with the exceptions that in place of an ingestion rate, a soil adherence factor of 0.2 mg soil/cm2 of skin, an exposed skin surface area of 3000 cm2 (roughly a third of the body surface area for this age child; MassDEP 1994) and constituent-specific relative absorption factors were used. Using these assumptions, the ADD and LADD can be estimated using the formula:

$$ADD/LADD = \frac{CS \times AD \times SA \times RAF \times EF \times ED}{BW \times 106\ (mg/kg) \times AT}$$

Where:

ADD = Average daily intake of the constituent (mg/kg/day),
LADD= Lifetime average daily dose (mg/kg/day),
CS = Constituent concentration in soil (mg/kg),
AD = Soil adherence to skin (0.2 mg/cm2; MassDEP 1995),
SA = Exposed skin surface area (3000 cm2; MassDEP 1995),
RAF = Relative absorption factor (constituent-specific; MassDEP 2006),
EF = Frequency of contact (109 days/year),
ED = Exposure Duration (5 years),
BW = Body weight (15 kg; EPA 1989), and
AT = Averaging Time (365 days x 5 yrs. (ADD) or 365 days x 70 days (LADD)).

The calculated ADD for children exposed to lead in soil at the site based on this equation is provided in Table 3 for exposure via dermal contact to the soil EPCs.

While the primary purpose of this assessment is to calculate whether an imminent hazard exists, the same approach can be modified slightly to assess overall site risks, given the continued use of the school and playground for current purposes. The assumption that children are unlikely to use the facility for more than 109 days per year, and for more than 5 years seems likely, given the grades (pre-K to 4th) that currently use the school. However, as a conservative measure, risks are also assessed assuming that children play at the school for 100 days per year over the course of a 10-year period and that they weigh 24 kg (average body weight for 2-12 years) over this period. This exposure and risk are calculated in Table 4.

Soil Exposure - Adults

Adults that may use the area would include school landscape workers, teachers, and parents attending games. Of these groups, landscapers would be expected to have the highest potential for regular contact. In order to determine if such soil contact is safe, exposure and risks to landscapers were evaluated quantitatively, using the previously-established EPCs.

Landscapers who work site soil may be exposed to constituents present in the soil by direct contact and subsequent ingestion of contaminated soil or by dermal absorption of constituents in soils adhering to the skin. Workers may also be exposed to constituents that become airborne as a component of windborne dust. Exposure for these people is assumed to occur for 100 days over the course of a year, assuming that during the roughly 8-month landscaping season, these workers are outdoors roughly 3 days per week over the 240-day period. Adults are estimated to weigh 70 kg. It should be noted that these calculations are particularly conservative in that exposure estimates are compared with toxicity values designed to be protective for chronic (long-term) exposures; toxicity values for short-term exposure are generally lower by a factor of 10.

Soil Ingestion: Workers in frequent contact with site soil are estimated to ingest 100 mg of soil per day (MassDEP 2002) and this value will be used for landscape workers. Using these assumptions and the others noted above, the ADD and LADD for soil ingestion by workers can be estimated using the formula for soil ingestion noted above. The calculated ADD for the constituents in soil at the property based on this equation is provided in Table 5 in Appendix A for soil ingestion exposure to the site-wide exposure point concentration.

Dermal Contact: Dermal exposure to constituents in soil can occur through direct physical contact with soil. The same assumptions as for soil ingestion are used, with the exceptions that in place of an ingestion rate, a soil adherence factor of 0.29 mg soil/cm2 of skin, an exposed skin surface area of 3,500 cm^2, and constituent-specific relative absorption factors were used. Using these assumptions, the ADD and LADD can be estimated using the formula for dermal contact noted above. The calculated ADD for the constituents in soil at the property based on this equation is

provided in Table 5 in Appendix A for exposure via dermal contact to the EPCs in soil.

Inhalation. Although unlikely considering the small area of uncovered soil, landscapers could be exposed via inhalation to constituents entrained in soil-derived dust (MassDEP 2002). To estimate exposure, the same assumptions provided above for body weight, lifetime exposure duration and frequency were used. It was assumed that the gardener inhaled 20 cubic meters (m3) of air during the time on site (essentially equal to the daily inhalation rate of 20 m^3/day; EPA, 1989 and corresponding to a full workday at an average moderate to heavy level of exertion; MassDEP 1995a).

In order to evaluate the potential for inhalation exposure to constituents entrained in the dust, it is necessary to estimate the amount of dust that would be present in the air, and the amount of air inhaled during the period that dust is present in the air. MassDEP (2002) suggests a value of 60 ug/m^3 for excavations and this value will be used in this evaluation, which is a conservative approach since excavation work would be expected to generate more dust than gardening. The value of 60 ug/m3 is based on the assumption that gardeners will only receive intermittent exposure to visible dust but that the average exposure level will be above that used by EPA for undisturbed sites.

MassDEP notes that exposure to constituents on airborne particulates can occur through either direct inhalation or via inhalation followed by movement of the particles from the upper respiratory tract to the gastrointestinal tract. For direct inhalation, MassDEP indicates that only approximately half of the inhaled particulate matter will actually reach the lungs. However, for this evaluation, it is assumed that all the agent inhaled is of concern, as many inhaled constituents act at sites along the respiratory tract and do not need to reach the lungs to have adverse effects. For the inhalation-to-oral pathway, the ingested dose is estimated to be twice the measured PM10 dose of 60 ug/m3. However, the total soil intake via this pathway (2 x 60 ug/m3 x 20 m3/day x 1 mg/1000 ug = 2.4 mg soil) is so low as to not add significantly to the soil dose calculated for direct ingestion and is not considered further in this assessment.

Exposure can be calculated using the equation:

$$ADE/LADE = \frac{EPC \times IF \times PM10 \times RAF \times EF \times ED}{BW \times AT}$$

Where:

ADE = Average daily exposure to the constituent (mg/m3),
LADE= Lifetime average daily dose (mg/m3),
EPC = Constituent concentration in soil (mg/kg),
IF = Inhalation Fraction (20 m3 / 20 m3day; MassDEP 2002),
PM10 = Particulate air concentration (60 ug/m3; MassDEP 2002).

RAF = Relative absorption factor (1 used to be conservative),
EF = Frequency of contact (100 days/year),
ED = Exposure Duration (5 years), and
AT = Averaging Time (365 days x 5 or 70 years).

Table 5 in Appendix A provides the estimated exposure and risk values for inhalation exposure to an adult landscaper, assuming no dust suppression measures are implemented. Exposure to other site users, including teachers and parents, would be expected to be lower.

3.1.5 Human Health Imminent Hazard Evaluation Results

Using the EPCs, exposure factors, and toxicity values discussed above, and using conventional risk characterization models, imminent hazard calculations were performed. The calculations are contained in *LaGoy Risk Analysis, Inc. (LaGoy)* "Evaluation of Soil Data from the Charles C. Cashman Elementary School, 193 Lions Mouth Road, Amesbury, Massachusetts dated July 27, 2020" and attached as Appendix A.

For noncarcinogenic (systemic) effects, EPA and MassDEP assume that there is a level below which no effects will occur (a threshold no effect concentration). To evaluate possible risk from exposure to noncarcinogenic contaminants, the average daily dose (ADD) is divided by the health criterion value [the reference dose (RfD)]. If the ADD:RfD ratio, also termed the hazard index or HI, is less than ten for all constituents (i.e., if the daily intake is below the health criterion), then the contaminant is considered unlikely to pose an Imminent Hazard (i.e., a significant risk under conditions of short-term exposure) to individuals exposed under the given scenario. If the HI is less than ten, the site does not pose an Imminent Hazard. For cancer risk, the exposure, termed the lifetime average daily dose or LADD is multiplied by the cancer slope factor to estimate cancer risk, and this risk is compared with a target risk level of 1 in 100,000 or 10-5.

Imminent hazards associated with short term exposure to site constituents in soil are estimated in Table 3 for children and in Table 5 for landscapers (and other adults). Based on these calculations, exposure by children to soil concentrations of site constituents results in a hazard index of 0.5 (soil ingestion plus dermal absorption risks combined) and a cancer risk of 1 x 10-5. Exposure by adults to soil concentrations of site constituents results in a hazard index of 0.08 (soil ingestion, dermal absorption, and inhalation exposures combined) and a cancer risk of 3 x 10-6. These levels do not exceed the Imminent Hazard criterion of an HI of ten and a cancer risk level of 10^{-5}, indicating that continued use of this site does not pose an imminent hazard.

Hazards and risks associated with longer term exposure to site constituents in soil are estimated in Table 4 in Appendix A for children and in Table 6 in Appendix A for

landscapers (and other adults). Based on these calculations, exposure by children to soil concentrations of site constituents results in a hazard index of 0.3 and a cancer risk of 1 x 10-5. Exposure by adults to soil concentrations of site constituents results in a hazard index of 0.08 and a cancer risk of 1×10^{-5}. These levels do not exceed the long-term risk targets of a cancer risk of 10^{-5} and an HI of 1, indicating that continued long term exposure at these concentrations would not pose a significant risk.

Based on these results, an imminent hazard to human health does not exist at the site.

3.2 Environmental Imminent Hazard Evaluation

The site property is developed for educational use and is partially paved or built on and partially uncovered. The developed areas of the site possess little potential environmental habitat because of human use; however, undeveloped portions of the site may serve as habitat for native flora and fauna. According to 40 CMR 40.0955(3), the following conditions constitute an imminent hazard to the environment:

- evidence of stressed biota attributable to the release at the disposal site, including, without limitation, fish kills or abiotic conditions; or

- a release to the environment of oil or hazardous material which produces immediate or acute adverse impacts to freshwater or saltwater fish populations.

No such conditions are known to exist as a result of arsenic in site soil. Therefore, it is concluded that the site poses no imminent hazard to the environment.

3.3 Safety Imminent Hazard Evaluation

An imminent hazard to safety is evaluated by identifying conditions that could pose a threat of physical harm or bodily injury to existing receptors under current site conditions. Examples include the presence of an explosive environment or insecurely containerized waste.

No conditions representative of an imminent hazard to safety exist on the site. Based on these factors, it is concluded that no imminent hazard to safety exists at the site.

4.0 SUMMARY, CONCLUSION & RECOMMENDATIONS

An IHE was performed for the presence of arsenic in soil of the Cashman school property. The IHE examined potential imminent hazards to the health of students, non-student users of the playing fields, commercial (school) workers, and construction/utility workers not protected by conditions of an adequate Health and Safety Plan. The IHE also evaluated potential imminent hazards to the environment and safety. The IHE concludes the following:

- The site poses no imminent hazard to students, non-student users of the playing fields, school workers, and construction/utility workers.
- The site poses no imminent hazard to the environment.
- The site poses no imminent hazard to safety.

Soil was recently sampled by *ECMS* and analyzed with respect to the Cashman Elementary School property located at 193 Lions Mouth Road in Amesbury, Massachusetts. Arsenic and several other metals were detected at levels above a reportable concentration (arsenic) and above levels expected in background soil. However, no anthropogenic source of arsenic was present, the Amesbury area is known to have naturally-elevated arsenic levels in soil, and the source appears most likely to be natural. Further assessment will be required to determine if the source of arsenic detected on the Site is naturally occurring and presented with lines of evidence as part of the development of a Conceptual Site Model (CSM) for this "release". While the arsenic is assumed to be naturally occurring, calculations were performed to assess if a calculated risk was present for either short-term (IH) or longer-term exposure. Evaluation of the concentrations detected and of site-specific factors indicates that an Imminent Hazard condition does not exist at the site. Use of the site would also not pose a Significant Risks.

It should be noted that calculated risks did not exceed but were at the target risk levels. Therefore, although the area does not pose an Imminent Hazard or Significant Risk for current use, considering the use of the site as a school, it may be prudent to take measures to mitigate the potential for exposure. Such measures could include replacing natural soil in areas of exposed soil with imported soil containing lower levels of natural arsenic.

In order to ensure that public health is adequately protected, conservative assumptions (i.e., those unlikely to underestimate risk) were used in deriving both the exposure estimates and the toxicity values that are included in this letter report. Because of the use of these conservative assumptions, it is likely that the actual potential for non-cancer and cancer risks is lower than as is estimated in this report.

< indicates less than the respective method detection limit.
mg/kg = milligrams per kilogram
µg/kg = micrograms per kilogram
Boldfaced type indicates an exceedance.

RE: Evaluation of Soil Data from the Charles C. Cashman Elementary School, 193 Lions Mouth Road, Amesbury, Massachusetts

Dear Kevin:

I reviewed the soil data collected by Environmental & Construction Management Services, Inc. (ECMS) on July 9, 2020, from the Charles C. Cashman Elementary School property at 193 Lions Mouth Road in Amesbury, Massachusetts. I understand that samples were collected from loam and shallow (2 feet deep) subsoil near an existing baseball field on the property.

Based on my review and using standard calculations following the methodology required by the Massachusetts Department of Environmental Protection (MassDEP), the detected constituents do not pose an Imminent Hazard under the Massachusetts Contingency Plan (MCP), which is the relevant state regulatory program. Using the average concentration of arsenic and the maximum value of other metals that were detected above state-wide background levels for natural soil in Massachusetts as an exposure point concentration (EPC; the level of a constituent that an individual could regularly contact) and site-specific exposure assumptions provided on children and adults likely to use this field, the constituents that were detected do not pose an Imminent Hazard. I would also note that the use does not pose a calculated Significant Risk as that term is defined under the MCP, and that the arsenic appears to be present as a result of its presence in native soil. Although the site does not pose an Imminent Hazard under the MCP, steps to reduce or eliminate the potential for contact with these constituents and the associated soil at the site may still be prudent from both a risk management and MCP perspective.

Initial Evaluation

The Cashman school property in Amesbury, Massachusetts consists of a roughly 35-acre parcel that is currently used for pre-K through 4th grade students. The results of explorations performed at the property indicate that fill material identified at the site contains varying amounts of ash and cinders and may also contain remnants of the former residential building that had occupied the property prior to the garden.

The recent subject sampling event consisted of collecting 15 soil samples from beneath the grass (2-6 inches in depth), and two additional samples of slightly deeper soil (2 feet in depth). Soil was analyzed for the presence of metals, total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs, including the polycyclic aromatic hydrocarbons (PAHs), and pesticides and herbicides. The results of the sampling are presented in Table 1.

Only arsenic was present at a concentration above a reportable concentration. TPH was also detected in most samples (concentrations around 100 mg/kg) but could be present as a result of it use as a binder (waxes) in various lawn care products. Maximum metal concentrations were compared with expected concentrations in soil in Massachusetts (Table 2), and chromium, nickel, and vanadium were present at levels above expected background. The four metals, arsenic, chromium, nickel, and vanadium will be considered in the imminent hazard calculations.

The source of the arsenic is site soils does not appear to be associated with anthropogenic use but rather as a result of naturally-elevated arsenic concentrations. While arsenic was used widely for industrial purposes (e.g., for preservation of hides in tanning; as a pesticide as lead arsenates) the past use of the property is not consistent with these uses, and if the arsenic was present as a result of agricultural pesticide use, lead levels would be expected to be higher. Amesbury is in an area of Massachusetts known to have naturally elevated arsenic levels and consequently, its present is considered most likely to be attributable to natural sources. As such, its presence would not be regulated under the MCP but considering its location at a school, further assessment is prudent.

Imminent Hazard Calculations

An Imminent Hazard Evaluation (IHE) performed in accordance with the MCP evaluates whether constituents that are detected at a site could pose a risk of harm to human health, safety, public welfare, and the environment under current site conditions or for a short period of time (5 years, unless site conditions indicate a shorter time period is appropriate). For this site, the constituent of greatest concern, arsenic appears to be present as a result of natural background, and as such does not pose an imminent hazard. However, because of the use of the property as a school, further calculations are warranted to determine if some mitigation of the presence of even these natural soils may be warranted.

An Imminent Hazard does not exist if the cumulative cancer risk calculated for the short time period is below one in one hundred thousand (1×10^{-5} or 1E-05), the "hazard index" is below ten (10) for most constituents or below one (1) for constituents that have the potential to cause serious effects (specifically lead and cyanide, per a discussion with Nancy Bettinger of MassDEP BWSC ORS in January 2007, and trichloroethylene, per a discussion with Paul Locke of MassDEP in November 2012) following short-term exposures, and the site does not pose a risk to safety, public welfare, or the environment based on a consideration of site conditions and applicable standards. The results of the Imminent Hazard Risk Characterization are used as the basis for a decision as to whether or not an Immediate Response Action is necessary at the site.

This Imminent Hazard Evaluation has been conducted to specifically evaluate metals detected in soil at the Cashman Elementary School in Amesbury, Massachusetts. The purpose of this evaluation is to determine if a calculated Imminent Hazard to human health, as defined by the MCP, currently exists for the area for short-term exposure. Past exposure is likely to have been similar, so this IHE also provides information about possible past risks associated with use of the area.

This IHE focuses on human health. A consideration of site conditions indicates that the presence of the identified constituents does not pose an Imminent Hazard to public welfare, the environment, or safety.

Toxicity Assessment

The toxicity values for the metals are presented in Tables 3 and 5. Further description of the toxicity of arsenic, the metal of primary concern, is presented below.

Arsenic is a metalloid that has been shown to cause skin, bladder, and perhaps other cancers in individuals exposed through drinking water from wells with high arsenic levels. Arsenic has also been associated with an increased risk of lung cancer in exposed workers. Chronic exposure to arsenic at high levels causes adverse effects on the gastrointestinal tract. In addition, there is some evidence that exposure causes polyneuropathy. EPA has established an oral reference dose of 0.0003 mg/kg/day and an inhalation reference concentration of 2.5×10^{-5} mg/m^3. EPA has also established an oral cancer potency factor of 1.5 $(mg/kg/day)^{-1}$ and an inhalation unit risk of 0.003 $(ug/m^3)^{-1}$ and MassDEP uses these values.

Exposure Evaluation

As part of an IHE, concentrations of constituents detected in accessible surface soil can be used to evaluate the potential for actual exposure and risk with respect to current site uses and activities. The MCP defines accessible surface soil as soil that extends to a depth of 6 inches below the ground surface. As noted in MassDEP guidance, for an IHE, the focus is on short term risks, and maximum concentrations are typically used in the assessment as exposure point concentrations (EPCs; the concentration an individual could be exposed to on a regular basis). Maximum concentrations were used as EPCs for chromium, nickel, and vanadium. For this site, concentrations of arsenic in shallow soil

were detected in a narrow range (21.9 mg/kg – 82.3 mg/kg), and the 95% Upper Confidence Limit (UCL) calculated using the EPA's ProUCL model version 5.1 was used to calculate an EPC of 46.4 mg/kg for arsenic, based on a normal distribution of data and the Student t-test.

Quantitative Exposure Assessment

In general, individuals are exposed to materials released into the environment in varying quantities and proportions via a wide variety of possible exposure routes. The actual amount of material to which an individual is exposed depends on the individual's frequency, extent, and duration of exposure, which in turn depend on many factors, including location of residence, age, body weight, sex, and activity patterns. Patterns of exposure are highly variable among individuals. This large potential variation in exposure to environmental conditions implies that a certain amount of uncertainty is inherent in risk assessment. This exposure assessment uses standard approaches and assumptions that are designed to be health protective, i.e., they are designed to produce estimates of exposure that overestimate, rather than underestimate, actual exposure and risk.

The purpose of a quantitative exposure assessment is to estimate the Chronic Daily Intake (CDI) of each contaminant of concern by an individual for each exposure route. For carcinogens, the CDI is averaged over the full lifetime (by convention, assumed to be 70 years; MassDEP 2008) and is termed the Lifetime Average Daily Dose or LADD for oral and dermal exposures. For noncarcinogens, the dose is only averaged over the period of exposure and is noted as the Average Daily Dose or ADD for oral and dermal exposure.

Soil Exposure - Children

Children are at school 180 days per year, and can also use the school facilities during the summer (roughly 70 days; end of June to end of August) but will use the outdoor play fields for only a fraction of that time and for short periods. Very young children (less than 2 year of age) are considered unlikely to be present on a regular basis. For the purposes of this assessment, contact by children is assumed for 109 days per year, which is the outdoor time assumed by MassDEP (1994) in initially establishing the S-1 soil standards. Exposure for a third of a year to a single outdoor play area is unlikely but provides a conservative estimate of exposure potential. People who contact soil may be exposed to constituents present in the soil by direct contact and subsequent ingestion of contaminated soil or by dermal absorption of constituents in soils adhering to the skin. Younger children are of greatest concern for soil contact, and therefore, assessment of exposure to younger children can be used to conservatively evaluate the potential for risks to older students. For this IHE, children are estimated to weigh an average of 15 kg (33 lbs) based on the median weight for 5-year-old children (the youngest age likely to be regularly out on their own) determined in the NHANES II study for the US population in 1980 (MassDEP 1994). USEPA has reviewed more current data and has indicated average weights for humans have increased since that study.

Soil Ingestion: Children in regular contact with site soil are estimated to ingest 100 mg of soil per day (MassDEP 2002). All constituents in soil are assumed to be as available

from the soil as from the media used in the toxicity studies and, consequently, a relative absorption factor or RAF of one is used for these constituents. Using this assumption and the others noted above, the ADD and LADD for soil ingestion by children can be estimated using the formula:

$$\text{ADD/LADD} = \frac{\text{CS x IR x RAF x EF x ED}}{\text{BW x } 10^6 \text{ (mg/kg) x AT}}$$

Where:

ADD	=	Average daily intake of the constituent (mg/kg/day),
LADD	=	Lifetime average daily dose (mg/kg/day),
CS	=	Constituent concentration in soil (mg/kg),
IR	=	Soil ingestion rate (100 mg/day; MassDEP 1995),
RAF	=	Relative absorption factor (1),
EF	=	Frequency of ingestion (109 days/year; MassDEP 1995),
ED	=	Exposure Duration (5 years; MassDEP 1995),
BW	=	Body weight (15 kg; EPA 1989), and
AT	=	Averaging Time (365 days x 5 yrs (ADD) or 365 x 70 (LADD) days).

The calculated ADD for children exposed to lead detected in soil at the property based on this equation is provided in Table 3 for ingestion exposure to the soil at the school.

Dermal Contact: Dermal exposure to constituents in soil can occur through direct physical contact with soil. The same assumptions as for soil ingestion are used, with the exceptions that in place of an ingestion rate, a soil adherence factor of 0.2 mg soil/cm^2 of skin, an exposed skin surface area of 3000 cm^2 (roughly a third of the body surface area for this age child; MassDEP 1994) and constituent-specific relative absorption factors were used. Using these assumptions, the ADD and LADD can be estimated using the formula:

$$\text{ADD/LADD} = \frac{\text{CS x AD x SA x RAF x EF x ED}}{\text{BW x } 10^6 \text{ (mg/kg) x AT}}$$

Where:

ADD	=	Average daily intake of the constituent (mg/kg/day),
LADD	=	Lifetime average daily dose (mg/kg/day),
CS	=	Constituent concentration in soil (mg/kg),
AD	=	Soil adherence to skin (0.2 mg/cm^2; MassDEP 1995),
SA	=	Exposed skin surface area (3000 cm^2; MassDEP 1995),
RAF	=	Relative absorption factor (constituent-specific; MassDEP 2006),
EF	=	Frequency of contact (109 days/year),
ED	=	Exposure Duration (5 years),
BW	=	Body weight (15 kg; EPA 1989), and
AT	=	Averaging Time (365 days x 5 yrs (ADD) or 365 days x 70 days (LADD)).

The calculated ADD for children exposed to lead in soil at the site based on this equation is provided in Table 3 for exposure via dermal contact to the soil EPCs.

While the primary purpose of this assessment is to calculate whether an imminent hazard exists, the same approach can be modified slightly to assess overall site risks, given the continued use of the school and playground for current purposes. The assumption that children are unlikely to use the facility for more than 109 days per year, and for more than 5 years seems likely, given the grades (pre-K to 4th) that currently use the school. However, as a conservative measure, risks are also assessed assuming that children play at the school for 100 days per year over the course of a 10-year period and that they weigh 24 kg (average body weight for 2-12 years) over this period. This exposure and risk are calculated in Table 4.

Soil Exposure - Adults

Adults that may use the area would include school landscape workers, teachers, and parents attending games. Of these groups, landscapers would be expected to have the highest potential for regular contact. In order to determine if such soil contact is safe, exposure and risks to landscapers were evaluated quantitatively, using the previously-established EPCs.

Landscapers who work site soil may be exposed to constituents present in the soil by direct contact and subsequent ingestion of contaminated soil or by dermal absorption of constituents in soils adhering to the skin. Workers may also be exposed to constituents that become airborne as a component of windborne dust. Exposure for these people is assumed to occur for 100 days over the course of a year, assuming that during the roughly 8-month landscaping season, these workers are outdoors roughly 3 days per week over the 240-day period. Adults are estimated to weigh 70 kg. It should be noted that these calculations are particularly conservative in that exposure estimates are compared with toxicity values designed to be protective for chronic (long-term) exposures; toxicity values for short-term exposure are generally lower by a factor of 10.

Soil Ingestion: Workers in frequent contact with site soil are estimated to ingest 100 mg of soil per day (MassDEP 2002) and this value will be used for landscape workers. Using these assumptions and the others noted above, the ADD and LADD for soil ingestion by workers can be estimated using the formula for soil ingestion noted above. The calculated ADD for the constituents in soil at the property based on this equation is provided in Table 5 for soil ingestion exposure to the site-wide exposure point concentration.

Dermal Contact: Dermal exposure to constituents in soil can occur through direct physical contact with soil. The same assumptions as for soil ingestion are used, with the exceptions that in place of an ingestion rate, a soil adherence factor of 0.29 mg soil/cm^2 of skin, an exposed skin surface area of 3500 cm^2, and constituent-specific relative

absorption factors were used. Using these assumptions, the ADD and LADD can be estimated using the formula for dermal contact noted above. The calculated ADD for the constituents in soil at the property based on this equation is provided in Table 5 for exposure via dermal contact to the EPCs in soil.

Inhalation. Although unlikely considering the small area of uncovered soil, landscapers could be exposed via inhalation to constituents entrained in soil-derived dust (MassDEP 2002). To estimate exposure, the same assumptions provided above for body weight, lifetime exposure duration and frequency were used. It was assumed that the gardener inhaled 20 cubic meters (m^3) of air during the time on site (essentially equal to the daily inhalation rate of 20 m^3/day; EPA, 1989 and corresponding to a full workday at an average moderate to heavy level of exertion; MassDEP 1995a).

In order to evaluate the potential for inhalation exposure to constituents entrained in the dust, it is necessary to estimate the amount of dust that would be present in the air, and the amount of air inhaled during the period that dust is present in the air. MassDEP (2002) suggests a value of 60 ug/m^3 for excavations and this value will be used in this evaluation, which is a conservative approach since excavation work would be expected to generate more dust than gardening. The value of 60 ug/m^3 is based on the assumption that gardeners will only receive intermittent exposure to visible dust but that the average exposure level will be above that used by EPA for undisturbed sites.

MassDEP notes that exposure to constituents on airborne particulates can occur through either direct inhalation or via inhalation followed by movement of the particles from the upper respiratory tract to the gastrointestinal tract. For direct inhalation, MassDEP indicates that only approximately half of the inhaled particulate matter will actually reach the lungs. However, for this evaluation, it is assumed that all the agent inhaled is of concern, as many inhaled constituents act at sites along the respiratory tract and do not need to reach the lungs to have adverse effects. For the inhalation-to-oral pathway, the ingested dose is estimated to be twice the measured PM_{10} dose of 60 ug/m^3. However, the total soil intake via this pathway (2 x 60 ug/m^3 x 20 m^3/day x 1 mg/1000 ug = 2.4 mg soil) is so low as to not add significantly to the soil dose calculated for direct ingestion and is not considered further in this assessment.

Exposure can be calculated using the equation:

$$ADE/LADE = \frac{EPC \times IF \times PM10 \times RAF \times EF \times ED}{BW \times AT}$$

Where:

ADE = Average daily exposure to the constituent (mg/m^3),
LADE= Lifetime average daily dose (mg/m^3),
EPC = Constituent concentration in soil (mg/kg),
IF = Inhalation Fraction (20 m^3 / 20 m^3day; MassDEP 2002),
PM10 = Particulate air concentration (60 ug/m^3; MassDEP 2002).
RAF = Relative absorption factor (1 used to be conservative),

EF	=	Frequency of contact (100 days/year),
ED	=	Exposure Duration (5 years), and
AT	=	Averaging Time (365 days x 5 or 70 years).

Table 5 provides the estimated exposure and risk values for inhalation exposure to an adult landscaper, assuming no dust suppression measures are implemented. Exposure to other site users, including teachers and parents, would be expected to be lower.

Health Risks at the Site

In this section, information concerning the potential levels of exposure to contaminants is combined with information concerning the toxicity of the contaminants in order to determine the potential health risks at the property. For noncarcinogenic (systemic) effects, EPA and MassDEP assume that there is a level below which no effects will occur (a threshold no effect concentration). To evaluate possible risk from exposure to noncarcinogenic contaminants, the average daily dose (ADD) is divided by the health criterion value [the reference dose (RfD)]. If the ADD:RfD ratio, also termed the hazard index or HI, is less than ten for all constituents (i.e., if the daily intake is below the health criterion), then the contaminant is considered unlikely to pose an Imminent Hazard (i.e., a significant risk under conditions of short-term exposure) to individuals exposed under the given scenario. If the HI is less than ten, the site does not pose an Imminent Hazard. For cancer risk, the exposure, termed the lifetime average daily dose or LADD is multiplied by the cancer slope factor to estimate cancer risk, and this risk is compared with a target risk level of 1 in 100,000 or 10^{-5}.

Imminent hazards associated with short term exposure to site constituents in soil are estimated in Table 3 for children and in Table 5 for landscapers (and other adults). Based on these calculations, exposure by children to soil concentrations of site constituents results in a hazard index of 0.5 (soil ingestion plus dermal absorption risks combined) and a cancer risk of 1×10^{-5}. Exposure by adults to soil concentrations of site constituents results in a hazard index of 0.08 (soil ingestion, dermal absorption, and inhalation exposures combined) and a cancer risk of 3×10^{-6}. These levels do not exceed the Imminent Hazard criterion of an HI of ten and a cancer risk level of 10^{-5}, indicating that continued use of this site does not pose an imminent hazard.

Hazards and risks associated with longer term exposure to site constituents in soil are estimated in Table 4 for children and in Table 6 for landscapers (and other adults). Based on these calculations, exposure by children to soil concentrations of site constituents results in a hazard index of 0.3 and a cancer risk of 1×10^{-5}. Exposure by adults to soil concentrations of site constituents results in a hazard index of 0.08 and a cancer risk of 1×10^{-5}. These levels do not exceed the long-term risk targets of a cancer risk of 10^{-5} and an HI of 1, indicating that continued long term exposure at these concentrations would not pose a significant risk.

A number of assumptions were used in deriving the exposure estimates and toxicity criteria. While there is some uncertainty in the resulting hazard and risk estimates, conservative (health protective) assumptions were made so actual hazards and risks are likely to be lower than the calculated hazards and risks.

Conclusions and Recommendations

Soil was recently sampled by ECMS and analyzed with respect to the Cashman Elementary School property located at 193 Lions Mouth Road in Amesbury, Massachusetts. Arsenic and several other metals were detected at levels above a reportable concentration (arsenic) and above levels expected in background soil. However, no anthropogenic source of arsenic was present, the Amesbury area is known to have naturally-elevated arsenic levels in soil, and the source appears most likely to be natural. While the arsenic is assumed to be naturally occurring, calculations were performed to assess if a calculated risk was present for either short-term (IH) or longer-term exposure. Evaluation of the concentrations detected and of site-specific factors indicates that an Imminent Hazard condition does not exist at the site. Use of the site would also not pose a Significant Risks.

It should be noted that calculated risks did not exceed but were at the target risk levels. Therefore, although the area does not pose an Imminent Hazard or Significant Risk for current use, considering the use of the site as a school, it may be prudent to take measures to mitigate the potential for exposure. Such measures could include replacing natural soil in areas of exposed soil with imported soil containing lower levels of natural arsenic.

In order to ensure that public health is adequately protected, conservative assumptions (i.e., those unlikely to underestimate risk) were used in deriving both the exposure estimates and the toxicity values that are included in this letter report. Because of the use of these conservative assumptions, it is likely that the actual potential for non-cancer and cancer risks is lower than as is estimated in this report.

If you have any questions, please give me a call.

Sincerely,

Peter K. LaGoy
Principal

APPENDIX B

QUALIFICATIONS/LIMITATIONS

QUALIFICATIONS/LIMITATIONS

Environmental & Construction Management Services, Inc. (ECMS) professional services have been performed, our findings obtained, and our recommendations prepared in accordance with customary principles and practices in the fields of environmental science and engineering. This warranty is in lieu of all other warranties either expressed or implied. *ECMS* is not responsible for the independent conclusions, opinions or recommendations made by others based on the records review, site inspection, field exploration, and laboratory test data presented in this report.

Factual information regarding on-site business operations, conditions, and historical data provided to *ECMS* is assumed to be correct and complete. *ECMS* assumes no responsibility for hidden or latent conditions or misrepresentation by the property owner, its representatives, public information officials or any authority consulted in connection with the compilation of this report.

The findings set forth in the attached Site assessment report are strictly limited in time and scope to the date of the evaluation(s). The conclusions presented in the Report are based solely on the services described therein, and not on scientific tasks or procedures beyond the scope of agreed upon services or the time and budgeting restraints imposed by the client.

The purpose of this report was to assess the physical characteristics of the subject Site with respect to the presence in the environment of hazardous material or oil. No specific attempt was made to check on the compliance of present or past owners or operators or of the Site with Federal, State or local laws and regulations, environmental, or otherwise.

Partial findings of this investigation are based on data provided by others. No warranty is expressed or implied with the usage of such data. Much of the information provided in this report is based upon personal interviews and research of all available documents, records and maps held by the appropriate government and private agencies. This is subject to the limitations of historical documentation, availability and accuracy of pertinent records, and the personal recollection of those persons contacted by *ECMS* personnel. *ECMS* is not a professional title insurance firm and makes no guarantee, explicit or implied that the listing, which was reviewed, represented a comprehensive delineation of past Site ownership or tenancy for legal purposes.

Observations were made of the Site and of structures on the Site as indicated within the Report. Where access to portions of the Site or to structures on the Site was unavailable or limited, *ECMS* is unable to render an opinion as to the presence of hazardous material or oil, or to the presence if indirect evidence relating to hazardous material or oil, in that portion of the Site or structure. In addition, *ECMS* renders no opinion as to the presence of hazardous material or oil, where direct observation of the interior walls, floor, or ceiling of a structure on a Site was obstructed by objects or coverings on or over these surfaces.

The initial site investigation took into account the natural and man-made features of the Site, including any unusual or suspect phenomenon. These factors combined with the Site's geology, hydrology, topography, and past and present land uses served as a basis for choosing a methodology and location for subsurface exploration as well as ground water and subsurface sampling, if done. The subsurface data, if provided, is meant as a representative overview of the Site.

The conclusions and recommendations contained in this report may be based in part upon various types of chemical data and are contingent upon their validity. As indicated within the Report, some

of these data are preliminary "screening" level data, and should be confirmed with quantitative analyses if more specific information is necessary. It should be noted that variations in the types and concentrations of contaminants and variations in their flow paths may occur due to seasonal water table fluctuations, past disposal practices, the passage of time, and other factors. Should additional data or variations of current data become available in the future, these data should be reviewed, and the conclusions and recommendations presented herein modified accordingly.

Chemical analyses may have been performed for specific parameters during the course of this Site assessment, as described in the text. However, it should be noted that additional chemical constituents not searched for during the current study might be present in soil and/or ground water at the Site.

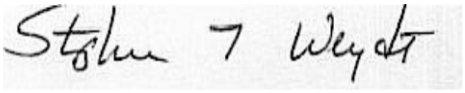
CERTIFICATION OF RESULTS

The evaluation was conducted on behalf of and for the exclusive use of *DiNisco Design* and their client, the *City of Amesbury, Massachusetts* and all its successors and assigns, solely for use in an environmental evaluation of the Site. This report and the findings contained herein shall not, in whole or in part, be disseminated or conveyed to any other party, nor used by any other party, in whole or in part, other than *DiNisco Design* or the *City of Amesbury* and all its successors and assigns, without the prior written consent of *Environmental & Construction Management Services, Inc. (ECMS).*



ECMS professional services have been performed, our findings obtained, and our recommendations prepared by an environmental professional and customary principles and practices in the fields of environmental science and engineering. This warranty is in lieu of all other warranties either expressed or implied. *ECMS* is not responsible for the independent conclusions, opinions or recommendations made by others based on the records review, site inspection, field exploration, and laboratory test data presented in this report.

Respectfully submitted this 17th day of September 2020.

Principal Environmental Scientist

1.0 INTRODUCTION

This Release Notification Retraction (retraction) was prepared based upon an evaluation of additional site data and discussions with Massachusetts Department of Environmental Protection (MassDEP) regarding elevated concentrations of arsenic detected in the soils at the Cashman Elementary School Site, located at 193 Lions Mouth Road in Amesbury, Massachusetts. The release is identified by the MassDEP as Release Tracking Number (RTN) 3-36397. This retraction was prepared in accordance with the requirements of the Massachusetts Contingency Plan (MCP) 310 CMR 40.0000, Section 40.0335 and other relevant guidance developed by the MassDEP.

A Release Notification Transmittal Form (RNF) BWSC-103 for the retraction has been submitted to the MassDEP via eDEP. A copy of the RNF Transmittal Form BWSC-103 is attached as Appendix A.

2.0 PROPERTY DESCRIPTION

2.1 Location and Legal Description of the Site

The Site is an irregularly-shaped 35.32-acre parcel of land located at 193 Lions Mouth Road in Amesbury, Essex County, Massachusetts 01913. According to the City of Amesbury Assessor, the property is listed as three (3) parcels including 50/6, 50/16 and 50/42. In addition, a portion of the Woodsom Farm (Parcel 37/4) is part of the proposed project. The Site is occupied by the Charles C. Cashman Elementary School and associated athletic fields, playground, parking lots and landscaped areas. Refer to Figure 2 entitled Lot Location Plan.

The Site is depicted on the 7.5 x 15-minute U.S.G.S. topographic quadrangle for Newburyport, Massachusetts dated 1987. The Universal Transverse Mercator (UTM) coordinates of the Site within zone 19 are approximately 4,746,558 meters north latitude and 340,818.9 meters east longitude or 42° 51' 26.06'' north latitude and 70° 56' 54.07'' west longitude. Elevation at the site is approximately 105 feet above mean sea level (amsl). Figure 1 includes both a Site Locus Plan and a Street Location Map of the Site. The Site and surrounding properties are shown on Figure 2, Lot Location Plan attached to this report.

2.2 Site and Vicinity Characteristics

The Site is currently occupied by the City of Amesbury Cashman Elementary School housing grades Pre-kindergarten through 4 (approximately 458 children). The Site is located within OSC – Open Space Conservancy. The school building is surrounded by a driveway and associated paved parking lots, a playground area and grass athletic fields and two (2) little league baseball fields (Randall and Packer Fields).

Woodsom Farm to the west, and is accessed from Lions Mouth Road to the South. The north edge of the site is steeply sloping forested hill with an intermittent stream at the base. The Site is surrounded with pockets of densely settled residential neighborhoods.

No existing commercial printing facilities, gasoline filling/service stations, industrial properties or fuel depots were identified in the immediate vicinity of the subject site. The past uses of these surrounding properties do not pose recognized environmental concerns to the Site.

2.3 Descriptions of Structures, Roads, Other Improvements on the Site

The 2-story school building is 61,472 gross square feet (GSF). The building is constructed of masonry block with brick veneer on slab on grade construction.

Assessor Office records indicate that the main Site building construction was completed in 1975. The school building is currently heated by natural gas and heated through forced air ducts. The roof is asphalt and on the roof are several HVAC units. Records indicate, the building is and always has been heated by natural gas. Copies of the City of Amesbury Assessor Property Record Cards for the project are attached as Appendix B.

The nearest surface water bodies to the Site is Lake Gardner that is located approximately 2,500 feet to the north-northeast. According to the City of Amesbury Health Department, there are no know public or private potable water supply wells in the vicinity of the Site.

The City of Amesbury obtains its drinking water from its watershed area that encompasses about 55 square miles; most of which reside in New Hampshire. Tuxbury Pond feeds the Powow River, which the treatment plant draws from. Lake Attitash and Meadowbrook also supplement the water source seasonally and in times of drought. All of Amesbury's wastewater empties into their municipal sewer system. The wastewater treatment facility is located at 19 Merrimac Street.

The site is currently supplied with natural gas and serviced by the municipal water and sewer systems.

The existing school building has a sewage ejector system that was observed along the entrance driveway area south of the school.

2.4 Site Ownership

According to City of Amesbury Assessor's records, the subject site is owned by the City of Amesbury as of December 30, 1971 (Book 5833, Page 124).

2.5 Current Uses of the Site

The Site is currently utilized as the City of Amesbury Cashman Elementary School for grades Pre-K through Grade 4.

2.6 Current Uses of Surrounding Properties

The Site is located within an area primarily used for single-family residential homes, farmland and undeveloped wooded vacant land. There were no visual indications observed during *ECMS* visual inspection of nearby or abutting properties of conditions that would indicate a release or threat of release of oil and/or hazardous substances on, at, in, or to the Site.

2.7 Past Uses of the Site and Vicinity

Prior to the site investigation, *ECMS* prepared a Phase I Environmental Site Assessment (ESA) dated September 13, 2018 included interviews with officials from the City of Amesbury and review of readily available information on site history. Historical information was obtained from a review of the historical topographs (1932, 1934, 1943, 1944, 1947, 1950, 1956, 1952, 1968, 1973, 1979, 1971, 1985, 1987 and 2012), historical aerial photos (1953, 1960, 1966, 1973, 1978, 1986, 1992, 1998, 2006, 2009, 2012 and 2016), City Directory (1961, 1965, 1968, 1973, 1977, 1982, 1987, 1992, 1995, 2000, 2005, 2010 and 2014). Refer to Appendix C for copies of the above historic documents.

The historical aerial photo from 1978 shows the school building. Prior to construction of the school building, the Site land area was undeveloped and appears to be farmland as depicted in the aerial photographs from 1953 through 1973. The farm was used as a dairy farm and for the growing of hay.

Properties surrounding the Site to the north, south, east and west were developed with sporadic residential properties and some may have been farmland.

The past uses of these surrounding properties do not pose recognized environmental concerns to the Site.

3.0 SENSITIVE RECEPTORS

3.1 Human Receptors

The property consists of Cashman Elementary School, which enrolls approximately 443 students and employs approximately 50 full- and part-time staff. Human receptors at the property include children, adult staff, and visitors (adult and child).

Under reasonably foreseeable future exposure scenarios, subsurface utility or construction workers on the site would also be potential human receptors.

The property is located within a residential area of Amesbury. Numerous residential properties were identified within 500 feet of the property. The property itself is a public school. No other public schools or "institutions," as defined by the MCP, have been identified within 500 feet of the property. An "institution" is defined in the MCP as a hospital, health care facility, orphanage, nursing home, convalescent home, educational facility, or correctional facility, where such facility in whole or in part provides overnight housing. Consistent with 310 CMR 40.0361, reporting category RCS-1 is applicable to the property based upon the presence of residential properties within 500 feet.

According to an on-line MassDEP MCP Numerical Ranking System (NRS) map of the property and vicinity, the property is not located within 500 feet of any public drinking water sources, including Potentially Productive Aquifers, Zone II areas, Interim Wellhead Protection Areas, Zone A areas, or private wells. Consistent with 310 CMR 40.0361, reporting category RCGW-2 is applicable to the property because it is not within a current or potential drinking water source area. Refer to Figure 6 for a copy of the MassDEP Priority Resource (21E) Map.

3.2 Environmental Receptors

Sensitive environmental receptors at the property include wetlands associated with Cashman Elementary School, located on the northern and western side of the property approximately 250 feet north and northwest of the school building. According to the NRS map, wetlands associated with an unnamed brook to the east. No other surface waters (including wetlands, vernal pools, ponds, lakes, streams, rivers, and reservoirs) have been documented within 500 feet. A wetland area located within 0.5 mile to the southwest of the property is designated a Natural Heritage and Endangered Species Program (NHESP) Potential Vernal Pool.

According to information in the *Massachusetts Natural Heritage Atlas* (updated August 1, 2017), no certified vernal pools, priority habitats of rare species or estimated habitats of rare wildlife were identified within a 500-foot radius of the site. Refer to Figures 3 for a Map of Priority Habitats of Rare Species and Figure 4 for a Map of Estimated Habitats of Rare Wildlife and Certified Vernal Pools.

4.0 INITIAL SITE INVESTIGATION – PRE-CONSTRUCTION SOIL SAMPLING

At the request of the Project Architect *DiNisco Design, Inc. (DiNisco)*, *ECMS* completed the collection of loam/topsoil and subsoils samples from representative areas proximate to the Cashman Elementary School and from the field adjacent to the school for laboratory analysis for potential oil and/or hazardous material (OHM) prior to proposed site construction activities. Photographs were taken by *ECMS* personnel and are attached as Appendix D.

In Massachusetts, the regulatory program that concerns releases of OHM to the environment is the MCP 310 CMR 40.0000. This program is implemented by the MassDEP and includes specific provisions regarding releases of OHM to the environment that must be reported to the MassDEP.

4.1 Initial Soil Sampling and Analysis

On July 9, 2020, *ECMS* personnel collected fifteen (15) surficial loam/topsoil and two (2) subsoil samples. The samples were collected from areas identified by *DiNisco Design (DiNisco)* in "Proposed Topsoil Removal Limit Plan (Markup)" dated May 15, 2020. Refer to Figure 9, Soil Sample Location Plan for the location of the soil samples. Loam/topsoil samples were collected below the grass surface from 2 to 6 inches below surface grade and subsurface soil samples were collected approximately 2 feet below grade at refusal.

All soil samples were analyzed under chain of custody (COC) by Massachusetts approved laboratory *Eurofins Spectrum Analytical* (*Eurofins Spectrum*) of North Kingstown, Rhode Island for Comm97 Soil Laboratory Analysis plus additional analysis for Mass Reclamation Facilities which includes: Volatile Organic Compounds (VOCs) by Environmental Protection Agency (EPA) Method 8260, Semi Volatile Organic Compounds (SVOCs) by EPA Method 8270, Polychlorinated Biphenyls (PCBs) by EPA Method 8082 and Total Petroleum Hydrocarbons (TPH) by Gas Chromatograph (GC), MassDEP 14 Metals, Herbicides and Pesticides by EPA Method 8151A and Method 8151B. Additionally, all soil samples were further characterized by the analysis of pH, flashpoint and reactivity (cyanide and sulfide).

4.2 Initial Soil Sampling Results

No concentrations of OHM in any of the fifteen (15) loam/topsoil and/or two (2) subsoil samples analyzed were detected above their applicable reportable concentration RCS-1 specified in Massachusetts Oil and Hazardous Materials List (MOHML) 310 CMR 40.1600 and 310 CMR 40.0300 with the exception of arsenic. Concentrations of arsenic in all 17 soil samples submitted were detected above their RCS-1 of 20 milligrams per kilogram (mg/kg). The concentrations of arsenic ranged between 20.5 mg/kg and 82.3 mg/kg with an RCS-1 of 20 mg/kg. No concentrations

of arsenic were detected above their applicable upper concentration limit (UCL) of 500 mg/kg. A copy of the laboratory results and their respective MCP RCS-1 reporting concentrations (RCs) are presented in Tables 1 through 4.

In addition, several SVOC compounds were above their applicable MCP RCS-1 310 CMR 40.0300 and 40.1600 criteria. The method detection limits (MDLs) for these compounds are generally less than one order magnitude over their respective MDL and the past use of the site does not include the past use, storage of application of any OHM and therefore these compounds are not considered to be compounds of concern (COC).

In accordance with the MCP 310 CMR 40.0361: Reportable Concentrations of Oil and Hazardous Material in Soil:

> (1) For the purpose of determining whether a notification obligation exists under 310 CMR 40.0315, measured concentrations of any oil or hazardous material listed at 310 CMR 40.1600 shall be compared to the Reportable Concentration value in the reporting category that best characterizes the current use of the site under evaluation, as described below:
>
> > (a) Reporting Category RCS-1. Reporting category RCS-1 shall be applied to all soil samples obtained at or within 500 feet of a residential dwelling, a residentially-zoned property, school, playground, recreational area or park.

The detection of arsenic collected on July 9, 2020 in the site soils at concentrations exceeding their applicable RCS-1 triggers a 120-day notification requirement to the MassDEP under MCP 310 CMR 40.0315: Releases Which Require Notification Within 120 Days.

Additionally, since five (5) of the 17 soil samples exceeded a concentration of arsenic over 40 mg/kg the criteria for a release that could pose an Imminent Hazard to human health in accordance with MCP 310 CMR 40.0321(2) which is "a release to the environment indicated by the measurement of concentrations of hazardous material, equal to or greater than any of the following concentrations at the ground surface or within a depth of twelve (12) inches below the ground surface, at any location within 500 feet of a residential dwelling, school, playground, recreation area or park, unless access by children is controlled or prevented by means of bituminous pavement, concrete, fence, or other physical barrier". A release that could pose an Imminent Hazard to human health requires a "Two Hour" release notification obligation to the MassDEP.

4.3 Initial Recommendations

Due to the limited time to properly evaluate whether the detection of the concentrations of arsenic from the soil results from the July 9, 2020 soil precharacterization sampling prior to construction are naturally occurring as believed, *ECMS* recommended that the MassDEP be notified of a release that could pose an Imminent Hazard to human health requires a "Two Hour" release notification obligation.

As stated in MCP 310 CMR 40.0321(3) Notwithstanding the provisions of 310 CMR 40.0321(2) and 40.0321(3), a person required to notify under 310 CMR 40.0331 may demonstrate to the Department by a preponderance of the evidence that release or site conditions specified in 310 CMR 40.0321(2) and/or (3) do not constitute an actual Imminent Hazard to human health, in conformance with the Imminent Hazard Evaluation process described in 310 CMR 40.0426, and in consideration of the site-specific factors and the risk assessment and risk management criteria contained in 310 CMR 40.0950. No such demonstration, however, shall relieve any person of the obligation to notify the Department of a release or threat of release under the provisions of 310 CMR 40.0311 or 40.0312.

ECMS also recommended that an Imminent Hazard Evaluation (IHE) be completed to ensure that an Imminent Hazard did not exist.

ECMS prepared an IHE dated July 28, 2020 that was submitted to MassDEP on behalf of the City of Amesbury on August 14, 2020. Details and results of the IHE are including in Section 5.0 of this report.

4.4 MassDEP Notification and Oral IRA Approval

On July 24, 2020, Kevin J. Kavanaugh, LSP, CHMM of *ECMS* called the MassDEP-NERO, Bureau of Waste Site Cleanup on behalf of the City of Amesbury to report the 2-hour release condition in accordance with the requirements of the MCP 310 CMR 40.0313 for a release that could pose an Imminent Hazard to human health in accordance with MCP 310 CMR 40.0321(2) which is "a release to the environment indicated by the measurement of concentrations of hazardous material, equal to or greater than any of the following concentrations at the ground surface or within a depth of twelve (12) inches below the ground surface, at any location within 500 feet of a residential dwelling, school, playground, recreation area or park, unless access by children is controlled or prevented by means of bituminous pavement, concrete, fence, or other physical barrier".

Mr. Kenneth Sanderson of the MassDEP-NERO, Bureau of Waste Site Cleanup orally approved the proposed "assessment only" subsurface investigation to determine the nature and extent of the detection of arsenic. Other recommendations

included the restrictive fencing, posting warning signage and covering exposed soil with Polyethylene sheeting. A copy of the MassDEP Release Log Form (RLF) BWSC-101 is attached as Appendix E.

A Release Notification Form (RNF) BWSC-103 prepared by *ECMS* was electronically signed by Mr. Kevin J. Kavanaugh, LSP, CHMM for *ECMS* on behalf of the City of Amesbury and was submitted to the MassDEP on July 31, 2020 via eDEP. A copy of the RNF is also attached in Appendix F.

5.0 IMMEDIATE RESPONSE ACTION (IRA) ASSESSMENT ACTIVITIES

5.1 Imminent Hazard Evaluation (IHE)

ECMS prepared an IHE dated July 28, 2020 that was submitted to MassDEP on behalf of the City of Amesbury on August 14, 2020.

The purpose of an IHE was to evaluate whether an IRA is needed to control or reduce short-term exposure to a release of oil and/or hazardous material while comprehensive investigations and response actions are being evaluated. The need for comprehensive response actions (i.e., the ultimate actions for the release) is determined (in part) by a Risk Characterization, which is performed after all site investigations are completed.

For this IHE *ECMS* engaged *Mr. Peter LaGoy of LaGoy Risk Analysis, Inc. (LaGoy)* in Hopkinton, Massachusetts as a professional risk assessor to evaluate the recently obtained soil sample analytical results for samples collected on July 9, 2020.

The conclusions from the *LaGoy* "Evaluation of Soil Data from the Charles C. Cashman Elementary School, 193 Lions Mouth Road, Amesbury, Massachusetts dated July 27, 2020" are as follows:

- The site poses no imminent hazard to students, non-student users of the playing fields, school workers, and construction/utility workers.
- The site poses no imminent hazard to the environment.
- The site poses no imminent hazard to safety.

A copy of the *ECMS* IHE dated July 28, 2020 is attached as Appendix G.

5.2 Additional Soil Sampling, Analysis and Results

5.2.1 Baseball Field Infield Surface Sampling – July 31, 2020

On July 31, 2020, *ECMS* personnel collected four (4) surface soil samples from the infield of Randall Field (1st base, 2nd base, 3rd base and home plate) and four (4) surface soil samples from the infield of Packer Field (1st base, 2nd base, 3rd base and home plate). The soil appeared to be imported (noting its reddish color as well as its greater content of clay) and visually unlike the native soils encountered during the previous sampling of soils on July 9, 2020 by *ECMS*. Refer to Figure 9, Soil Sample Location Plan for the location of the soil samples.

All soil samples were analyzed under chain of custody (COC) by Massachusetts approved laboratory *Eurofins Spectrum* for MassDEP 14 Metals (including antimony, arsenic, beryllium, cadmium, chromium, lead, nickel, selenium, silver, thallium, vanadium, zinc, barium and mercury).

No concentrations of any of the MassDEP 14 Metals in any of the eight (8) infield surface samples analyzed were detected above their applicable reportable concentration RCS-1 specified in MOHML 310 CMR 40.1600 and 310 CMR 40.0300.

5.2.2 Packer Field Sampling and Background Sampling on the Woodsom Farm Property – August 12, 2020

On August 12, 2020, *ECMS* Licensed Site Professional (LSP) Kevin J. Kavanaugh met with Mr. Paul Giddings of the MassDEP Northeast Regional Office (NERO), Bureau of Waste Site Cleanup to collected additional soil samples for laboratory analysis for the presence of arsenic in an area that was previously found to have the highest concentration of arsenic in soils by *ECMS* on July 9, 2020 and in background areas in order to determine if the presence of arsenic on the Cashman School property is from a release at the Site or is consistently present in the environment at and in the vicinity of the sampling location that is solely attributable to natural geologic or ecologic conditions; and has not been mobilized or transferred to another environmental medium or increased in concentration in an environmental medium as a result of anthropogenic activities.

Mr. Giddings collected four (4) samples from two (2) different areas at depths between surface and 6 inches and increased depth approximately 16-18 inches below grade. *ECMS* collected eight (8) additional soil samples from the "background" areas on the Cashman School field property as well as from the Woodsom Farm property located west of the school property. All soils

appeared to be similar to those soils (dense light brown glacial till) encountered during the *ECMS* sampling on July 9, 2020 with the exception of the soil sample (designated as SSS-28) that was collected at a depth of between 18 and 20 inches in the outfield of Randall Field. This soil was found below approximately 6 inches of grass and loam and consisted of a more uniform brown medium to fine sand and was well graded and considered to be imported fill.

All *ECMS* collected soil samples were analyzed under proper COC by Massachusetts approved laboratory *Eurofins Spectrum* for MassDEP 14 Metals. Concentrations of arsenic was detected in 7 of the 8 soil samples submitted by *ECMS* above their RCS-1 of 20 mg/kg and 5 samples were also above the MassDEP IH concentration of 40 mg/kg. The concentrations of arsenic ranged between 4.89 mg/kg and 89.6 mg/kg. No concentrations of arsenic were detected above their applicable UCL of 500 mg/kg. Concentrations of the other 13 metals analyzed were all below their applicable RCS-1 concentration. A copy of the laboratory results and their respective MCP RCS-1 reporting concentrations (RCs) are presented in Table 6 and a copy of the *Eurofins Spectrum* Laboratory Report is attached as Appendix H.

All MassDEP collected soil samples were analyzed under proper COC by Massachusetts approved laboratory *Alpha Analytical* of Westborough, Massachusetts for arsenic and lead.

Concentrations of arsenic was detected in 4 of the 4 soil samples submitted by *MassDEP* were detected above their RCS-1 of 20 mg/kg and all samples were also above the MassDEP IH concentration of 40 mg/kg. The concentrations of arsenic ranged between 45.2 mg/kg and 66.6 mg/kg. No concentrations of arsenic were detected above their applicable UCL of 500 mg/kg. Concentrations of lead ranging between 10.9 and 38.8 mg/kg analyzed were all below their applicable RCS-1 concentration of 200 mg/kg. Refer to Figure 9, Soil Sample Location Plan for the location of the soil samples. A copy of the laboratory results and their respective MCP RCS-1 reporting concentrations (RCs) are presented in Table 7 and a copy of the Alpha Laboratory Report is attached as Appendix I.

6.0 SITE CONCEPTUAL MODEL & LINES OF EVIDENCE - ORIGIN OF ARSENIC IN SITE SOIL

6.1 Historical Documentation

The historical aerial photo from 1978 shows the school building. Prior to construction of the school building, the Site land area was undeveloped and appears to be farmland as depicted in the aerial photographs from 1953 through 1973.

Properties surrounding the Site to the north, south, east and west were developed with sporadic residential properties and some may have been farmland.

Woodsom Farm which lies adjacent to the northern and northwestern side of the Cashman School property is 365 acres in size and was purchased by the City of Amesbury in 1989 and is listed as a City Park (article 97). Note that not all of the 365 acres Woodsom Farm is article 97 as the corner where the proposed project egress drive will be located was designated "General Municipal Purposes" - Woodsom Farm Book: 9963, Page 317.

According to the Essex National Heritage Area society information Woodsom Farm was farmed as early as 1790, and at one time, was the largest dairy farm in Essex County. Hayfields, wetlands, woods, marshes and drumlins stretch across these 370 acres, bordered by the Powow River, and make the farm a scenic spot for walking, hiking, cross-country skiing and biking. Woodsom Farm is home to a diverse population of birds, including bobolinks, barn swallows, rock doves and meadowlarks. Species of Note include Bobolinks, rock doves, redwing blackbirds, mourning doves, meadowlarks and barn swallows. There were 41 different species (including unidentified warblers) seen on a June bird count. Habitats include grasslands, marsh, hayfields, drumlin hills and pasture land. There is no account that the farmland was utilized for anything else but a dairy farm and hayfields which would eliminate the historical use of herbicides and pesticides, particularly lead arsenate.

6.2 Arsenic Distribution

The distribution of arsenic in surface (depths from just below the grass to a maximum depth achieved of 24 inches) soil is heterogeneous, possibly reflecting perturbations by some reworking of the native soils. Twenty-nine (29) total soil samples were collected from a depth between just below the grass surface to a maximum of 24 inches below grade on both the Cashman School property and on the neighboring City of Amesbury owned Woodsom Farm property. Of the 29 samples collected 28 samples had arsenic concentrations greater than its applicable RCS-1 of 20 mg/kg and of those 28 samples, 15 had an arsenic concentration above its IH of 40 mg/kg. The one sample (designated SSS-28) that did not have an arsenic concentration over RCS-1 was collected from the outfield of Randall Field at a depth of 18-24 inches and consisted of a well-graded area that appeared to be fill related to the construction of the baseball field.

The highest arsenic found in site soils is in the deepest samples, and at several locations the arsenic concentration increases with increasing depth. This was noted in the samples collected by *ECMS* and MassDEP in what was considered to be a "background" or unworked portion of the Cashman School property (listed as samples "SSS-26" and "SSS-27" collected by *ECMS* and "DEP S-3 Background" and

"DEP S-4 Background" collected by MassDEP). Surficial application of arsenic would yield a concentration gradient that is the opposite of that observed at the site.

Elevated soil arsenic was also found at on the Woodsom Farm property at the same depth range as found on the Cashman School property. Soils appeared to be the same on both properties consisting of dry, brown, fine to coarse sand with little silt and trace gravel and trace root fibers in the top 6 inches below the grass cover.

No evidence has been found for the existence of a historical "point source" for arsenic at the school site, such as a pesticide manufacturer, tannery, or other industry using large quantities of arsenic. Historic and aerial maps also do not indicate the presence of any apple orchards in the area in the late 19th century, where arsenical pesticides (e.g., lead arsenate) may have been used on the Site and adjoining Woodsom farm property. Concentrations of lead were not found to be elevated beyond typical background levels thus eliminating the application of lead arsenate.

6.3 Soil Appearance

Soils sampled by *ECMS* within the first 6 inches consisted of dry, brown, fine to coarse sand with little silt and trace gravel and trace root fibers. In the areas sampled, little to no loam was observed. Soils sampled below 6 inches to a maximum of 24 inches were similar to those observed in the first 6 inches and deemed as subsoils.

The subsurface samples of unconsolidated deposits at the site contained arsenic-bearing minerals and elevated concentrations of arsenic. Although bedrock was not sampled, descriptions of bedrock, as observed in subsurface samples from the site, are consistent with published regional data indicating elevated arsenic levels in rock as published in the studies of the Merrimack and Nashoba formations.

6.4 Conclusions

Based on the data collected by *ECMS*, presented here and within the Retraction to which this memorandum is appended, along with the foregoing discussion, arsenic in the Cashman Elementary School soils is naturally occurring. This conclusion is supported by: the location of the site in a known and documented arsenic belt, appearance of site soils, the distribution of arsenic in the site soils; the comparison of site soil analytical results to arsenic concentrations off the property and in "background" locations; and the occurrence of the highest arsenic samples at depth.

7.0 RETRACTION OF RELEASE NOTIFICATION

Consistent with the provisions of 310 CMR 40.0335(1)(c), this release notification is being retracted on the basis that the subject release did not meet one or more of the sets of notification criteria specified in 310 CMR 40.0300. Specifically, releases of arsenic do not require notification pursuant to 310 CMR 40.0317(22) if they are in areas that are documented to have elevated arsenic measured in soil or groundwater that:

- is consistently present in the environment at and in the vicinity of the sampling location;
- is solely attributable to natural geologic or ecologic conditions; and
- has not been mobilized or transferred to another environmental medium or increased in concentration in an environmental medium as a result of anthropogenic activities.

The City of Amesbury lies within an area of Massachusetts that has been identified in studies by the United States Geological Survey (USGS) as being underlain by bedrock units, particularly the Merrimack and Nashoba formations, containing elevated arsenic concentrations (see *Arsenic and Uranium in Water from Private Well Completed in Bedrock of East-Central Massachusetts – Concentrations, Correlations with Bedrock Units, and Estimated Probability Maps*, John A. Colman, USGS, Scientific Investigations Report 2011-5013). Refer to Appendix J for a copy of the *Arsenic and Uranium in Water from Private Well Completed in Bedrock of East-Central Massachusetts – Concentrations, Correlations with Bedrock Units, and Estimated Probability Maps*, John A. Colman, USGS, Scientific Investigations Report 2011-5013.

Elevated concentrations of arsenic were detected in native soil across the site at all depths sampled, with the most elevated concentration detected just below the grass cover to a depth of 2 feet below grade. No field evidence was encountered that indicated soil had been disturbed or mobilized, or that an anthropogenic activity might have resulted in the elevated arsenic concentrations. As a result, *ECMS*, on behalf the City of Amesbury submitting this retraction in accordance MCP 310 MR 40.0335.

8.0 PROPOSED CONSTRUCTION OVERSIGHT

As stated in MCP 310 CMR 40.0335(6) *"*Nothing in 310 CMR 40.0335 shall limit the Department's authority to initiate, oversee, or order the performance of any response action deemed necessary by the Department to protect health, safety, public welfare, or the environment."

The presence of the arsenic detected on the Cashman School property should be properly managed to prevent exposure of arsenic present in the site's soils to protect health, safety, public welfare, and the environment.

ECMS proposed that a Health and Safety Plan (HASP) for use by construction workers and ancillary construction support staff during construction of a new school building and a Soil and Groundwater Management Plan that will provides a plan for the management of metals-impacted soil and groundwater that may be encountered during construction of a new elementary school building be prepared for the construction activities that will occur during the construction of the new school.

9.0 PUBLIC INVOLVEMENT

Although not required, a letter regarding this release notification retraction has been provided to the appropriate municipal officials. A copy of the letter is provided in Appendix K.

10.0 LIMITATIONS

This evaluation is based on the conditions existing at the property on the dates of property visits and field investigation activities. Past conditions are considered on the basis of readily available records, interviews, and recollections. Property conditions are subject to variations and changes over time. This report is based on the current fully-implemented environmental regulations.

Future regulatory modifications, agency interpretations, and/or attitude changes may affect the environmental status of the site.

Environmental & Construction Management Services, Inc. (*ECMS*) professional services have been performed, our findings obtained, and our recommendations prepared in accordance with customary principles and practices in the fields of environmental science and engineering. This warranty is in lieu of all other warranties either expressed or implied. *ECMS* is not responsible for the independent conclusions, opinions or recommendations made by others based on the records review, site inspection, field exploration, and laboratory test data presented in this report.

The findings set forth in the attached Site assessment report are strictly limited in time and scope to the date of the evaluation(s). The conclusions presented in the Report are based solely on the services described therein and not on scientific tasks or procedures beyond the scope of agreed upon services or the time and budgeting restraints imposed by the client.

The purpose of this report was to assess the physical characteristics of the subject Site with respect to the presence in the environment of hazardous material or oil. No specific attempt was made to check on the compliance of present or past owners or operators or of the Site with Federal, State or local laws and regulations, environmental, or otherwise.

Partial findings of this investigation are based on data provided by others. No warranty is expressed or implied with the usage of such data. Much of the information provided in this report is based upon personal interviews and research of all available documents, records, and maps held by the appropriate government and private agencies. This is subject to the limitations of historical documentation, availability and accuracy of pertinent records, and the personal recollection of those persons contacted by *ECMS* personnel. *ECMS* is not a professional title insurance firm and makes no guarantee, explicit or implied that the listing, which was reviewed, represented a comprehensive delineation of past Site ownership or tenancy for legal purposes.

Observations were made of the Site and of structures on the Site as indicated within the Report. Where access to portions of the Site or to structures on the Site was unavailable or limited, *ECMS* is unable to render an opinion as to the presence of hazardous material or oil, or to the presence if indirect evidence relating to hazardous material or oil, in that portion of the Site or structure. In addition, *ECMS* renders no opinion as to the presence of hazardous material or oil, where direct observation of the interior walls, floor, or ceiling of a structure on a Site was obstructed by objects or coverings on or over these surfaces.

The initial site investigation took into account the natural and man-made features of the Site, including any unusual or suspect phenomenon. These factors combined with the Site's geology, hydrology, topography, and past and present land uses served as a basis for choosing a methodology and location for subsurface exploration as well as ground water and subsurface sampling, if done. The subsurface data, if provided, is meant as a representative overview of the Site.

The conclusions and recommendations contained in this report May be based in part upon various types of chemical data and are contingent upon their validity. As indicated within the Report, some of these data are preliminary "screening" level data, and should be confirmed with quantitative analyses if more specific information is necessary. It should be noted that variations in the types and concentrations of contaminants and variations in their flow paths May occur due to seasonal water table fluctuations, past disposal practices, the passage of time, and other factors. Should additional data or variations of current data become available in the future, these data should be reviewed, and the conclusions and recommendations presented herein modified accordingly.

Chemical analyses May have been performed for specific parameters during the course of this Site assessment, as described in the text. However, it should be noted that additional chemical constituents not searched for during the current study might be present in soil and/or ground water at the Site.

ATTACHMENT TO OPINION OF MASSACHUSETTS LICENSED SITE PROFESSIONAL (LSP)

Name of Licensed Site Professional:	Kevin J. Kavanaugh
LSP Registration Number:	7610
Date of Opinion:	September 18, 2020
Client to Whom Opinion was Rendered:	DiNisco Design, Inc. and their client the City of Amesbury Massachusetts
Acceptance date of Agreement between *ECMS, Inc.* and *Client* pursuant to which Opinion was Rendered:	May 20, 2020
Release Tracking Number/Site No.:	3-36397

This Statement of Limitations and Conditions is an integral part of, and is incorporated by reference into, the Opinion of Massachusetts Licensed Site Professional referenced above.

LIMITATIONS

1. Purpose of Opinion

A. This Opinion is being provided in compliance with the requirements set forth in the Massachusetts Contingency Plan (MCP), 310 CMR 40.0000 et seq. Specifically, the LSP has prepared this Opinion at the request of the Client identified above as part of a Permanent Solution Statement. This stated purpose has been a significant factor in determining the scope and level of services required to render this Opinion.

B. Should the purpose for which this Opinion is to be used change, this Opinion shall no longer be valid.

2. General

A. This Opinion was prepared for the sole and exclusive use of *DiNisco Design* and their Client *the City of Amesbury* (Owner), subject to the provisions of the MCP. Except for Client, their attorneys, banker, or insurance carriers, no other party is entitled to rely in any way on the conclusions, observations, specifications, or data contained herein without the express written consent of *ECMS* and the LSP who rendered this opinion. Any use of this Opinion by anyone other than the Client, or any use of this Opinion by the Client or others for any purpose other than the stated purpose set forth above, without the LSP's review and the written authorization of *ECMS* and

the LSP, shall be at the user's sole risk, and neither *ECMS*, nor the LSP shall have any liability or responsibility therefore.

B. This Opinion was prepared pursuant to an Agreement between *ECMS* and the Client referenced above which defines the scope of work and sets out agreements regarding waivers of consequential damages, limitations on liability, and other important conditions and restrictions pursuant to which the Opinion is rendered. All uses of the Opinions are subject to and deemed acceptance of the conditions and restrictions contained in such Agreement.

3. Scope of Services

The observations and conclusions described in this Opinion are based solely on the Services provided pursuant to the Agreement with the Client and any approved additional services authorized by the Client. Without limitation of any other applicable limitations or conditions, neither *ECMS*, nor the LSP shall be liable for the existence of any condition, the discovery of which would have required the performance of services not authorized under this Agreement. To the best knowledge and behalf of *ECMS* and the LSP who signed this Opinion, no inquiry of an attorney-at-law having being made, no laws, regulations, orders, permits or approvals are applicable to the response actions to which this opinion relates except, if and to the extent applicable, M.G.L. c. 21A, Sections 19-19J, 309 CMR, M.G.L. c. 21E and 310 CMR 40.0000. Accordingly, this opinion is not intended to and does not address compliance with any other laws, regulations, orders, permits or approvals.

4. Changed Circumstances

The passage of time may result in changed technology, economic conditions or regulatory standards, manifestations of latent conditions, or the occurrence of future events, which would render this Opinion inaccurate or otherwise inapplicable. Neither *ECMS* nor the LSP shall be liable or responsible for the consequences of any such changed circumstances or conditions on the accuracy of this Opinion. In addition, under no circumstances shall the Client nor any other persons or entity rely on the information or conclusions contained in this Opinion after five (5) months from its date of submission without the express written consent of *ECMS* and the LSP. Reliance on the Opinion after such period of time shall be at the user's sole risk.

5. Should *ECMS* or the LSP be required or requested to review or authorize others to use this Opinion after its date of submission, *ECMS* shall be entitled to additional compensation at then existing rates or such other terms as may be agreed upon by *ECMS* and the Client. Nothing herein contained shall be deemed to require *ECMS* or the LSP to undertake any such review or authorize others to use this Opinion.

6. The conclusions stated in this Opinion are based upon [check and initial appropriate boxes]:

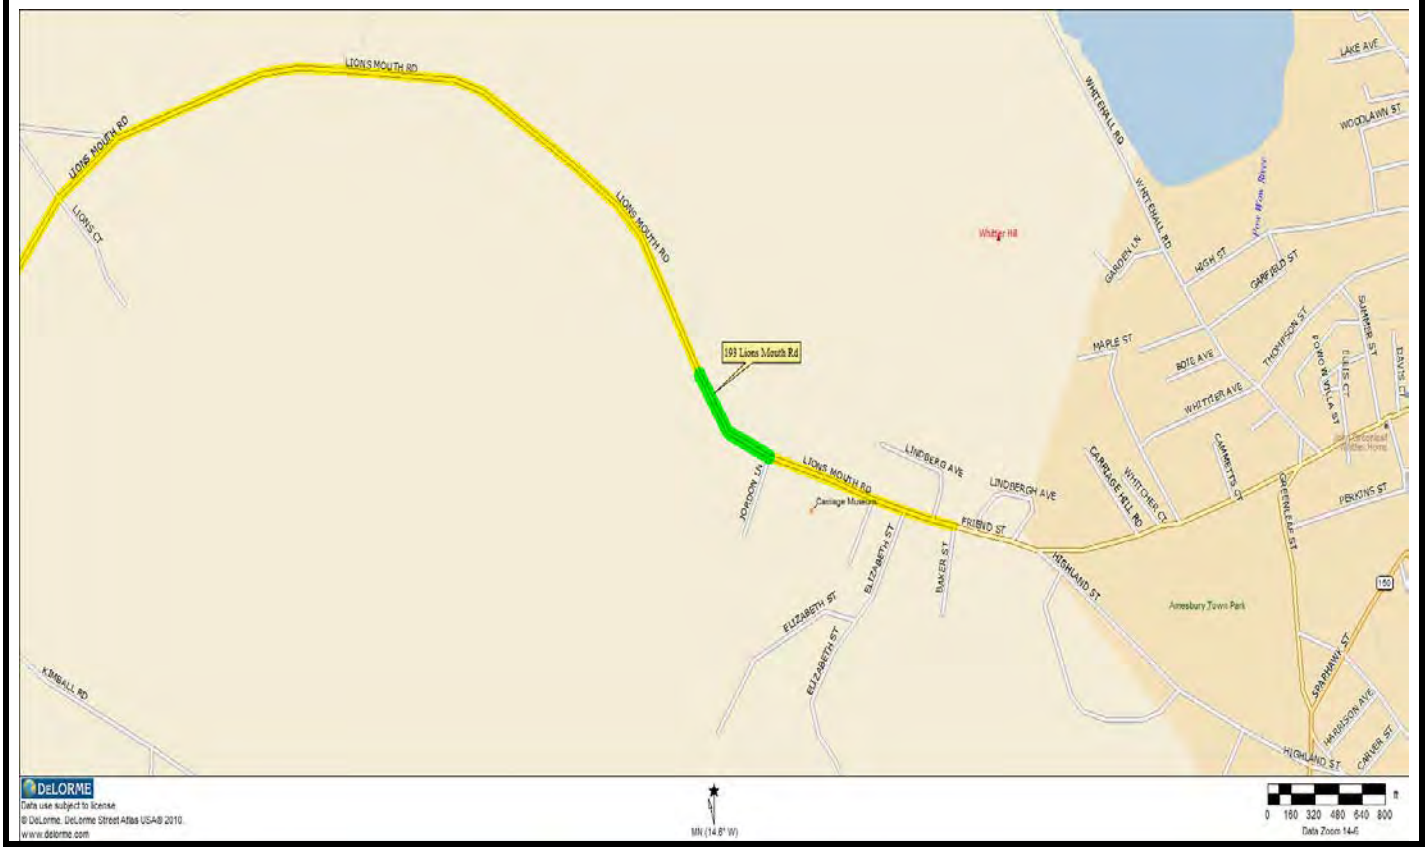
☑ KJK Visual inspection of existing physical conditions;

☑ KJK Review and interpretation of Site history and Site usage information which was made available or obtained within the scope of work authorized by the Client;

☑ KJK Information provided by the Client;

☑ KJK Information and/or analyses for designated substances or parameters provided by an independent testing service or laboratory on a limited number of samples;

☑ KJK A limited number of subsurface explorations made on dates indicated in documentation supporting this Opinion;



☐ _____ Other _____

Upon which the LSP has relied and presumed accurate, and upon which the LSP is entitled to reasonably rely. The LSP was not authorized and did not attempt to independently verify the accuracy or completeness of information or materials received from the Client and/or from laboratories and other third parties during the performance of its services. Neither *ECMS* nor the LSP shall be liable for any condition, information, or conclusion, the discovery of which required information available to the LSP or the independent investigation of information provided to the LSP by the Client and/or independent third parties.

This Opinion is rendered for the limited purpose stated above, and is not and should not be deemed to be an opinion concerning the compliance of any past or present owner or operator of the Site with any federal, state or local law or regulation. **No warranty or guarantee, whether expressed or implied, is made by the opinion, and any implied warranties of merchantability or fitness for a particular purpose are expressly disclaimed.** Without limiting the generality of the foregoing, no warranty is made that all contamination at a Site or sources of contamination has been detected or identified, that any action or recommended action will achieve all of its objectives, or that this opinion or any action as to which this Opinion relates will be upheld by any audit conducted by the Massachusetts Department of Environmental Protection (MassDEP) or any other party.

Total Petroleum Hydrocarbons (TPH) 8100 by GC (mg/kg)												
PH(TOT)	Total Petroleum Hydrocarbons	24.9	38.7	113	118	106	134	170	111	129	1000	

< indicates less than the respective method detection limit.
mg/kg = milligrams per kilogram
µg/kg = micrograms per kilogram
Bolfaced type indicates an exceedance.
Pursuant to MCP 310 CMR 40.0975(6)(a-c): MCP Method 1 Soil Standards, and Massachusetts Oil and Hazrdous Materials List (MOHML) revised (effective) 2014

< indicates less than the respective method detection limit.
mg/kg = milligrams per kilogram
µg/kg = micrograms per kilogram
Bolfaced type indicates an exceedance.

APPENDIX A

COPY OF RELEASE NOTIFICATION FORM (RNF) BWSC-103 FOR "RETRACTION"

Massachusetts Department of Environmental Protection
Bureau of Waste Site Cleanup

RELEASE NOTIFICATION & NOTIFICATION RETRACTION FORM

Pursuant to 310 CMR 40.0335 and 310 CMR 40.0371 (Subpart C)

BWSC 103

Release Tracking Number
3 - 36397

A. RELEASE OR THREAT OF RELEASE LOCATION:

1. Release Name/Location Aid: CHARLES C. CASHMAN ELEMENTARY SCHOOL
2. Street Address: 193 LIONS MOUTH ROAD
3. City/Town: AMESBURY 4. ZIP Code: 019130000
5. Coordinates: a. Latitude: N 42.85723 b. Longitude: W 70.94835

B. THIS FORM IS BEING USED TO: (check one)

- ☐ 1. Submit a **Release Notification**
- ☐ 2. Submit a **Revised Release Notification**
- ☑ 3. Submit a **Retraction of a Previously Reported Notification** of a release or threat of release including supporting documentation required pursuant to 310 CMR 40.0335 (Section C is not required)

(All sections of this transmittal form must be filled out unless otherwise noted above)

C. INFORMATION DESCRIBING THE RELEASE OR THREAT OF RELEASE (TOR):

1. Date and time of Oral Notification, if applicable: _____ (mm/dd/yyyy) Time: _____ (hh:mm) ☐ AM ☐ PM
2. Date and time you obtained knowledge of the Release or TOR: _____ (mm/dd/yyyy) Time: _____ (hh:mm) ☐ AM ☐ PM
3. Date and time release or TOR occurred, if known: _____ (mm/dd/yyyy) Time: _____ (hh:mm) ☐ AM ☐ PM

Check all Notification Thresholds that apply to the Release or Threat of Release:
(for more information see 310 CMR 40.0310 - 40.0315)

4. 2 HOUR REPORTING CONDITIONS

- ☐ a. Sudden Release
- ☐ b. Threat of Sudden Release
- ☐ c. Oil Sheen on Surface Water
- ☐ d. Poses Imminent Hazard
- ☐ e. Could Pose Imminent Hazard
- ☐ f. Release Detected in Private Well
- ☐ g. Release to Storm Drain
- ☐ h. Sanitary Sewer Release (Imminent Hazard Only)

5. 72 HOUR REPORTING CONDITIONS

- ☐ a. Subsurface Non-Aqueous Phase Liquid (NAPL) Equal to or Greater than 1/2 Inch (.04 feet)
- ☐ b. Underground Storage Tank (UST) Release
- ☐ c. Threat of UST Release
- ☐ d. Release to Groundwater near Water Supply
- ☐ e. Substantial Release Migration

6. 120 DAY REPORTING CONDITIONS

- ☐ a. Release of Hazardous Material(s) to Soil or Groundwater Exceeding Reportable Concentration(s)
- ☐ b. Release of Oil to Soil Exceeding Reportable Concentration(s) and Affecting More than 2 Cubic Yards
- ☐ c. Release of Oil to Groundwater Exceeding Reportable Concentration(s)
- ☐ d. Subsurface Non-Aqueous Phase Liquid (NAPL) Equal to or Greater than 1/8 Inch (.01 feet) and Less than 1/2 Inch (.04 feet)

C. INFORMATION DESCRIBING THE RELEASE OR THREAT OF RELEASE (TOR): (cont.)

7. List below the Oils (O) or Hazardous Materials (HM) that exceed their Reportable Concentration (RC) or Reportable Quantity (RQ) by the greatest amount.

☐ Check here if an amount or concentration is unknown or less than detectable.

O or HM Released	CAS Number, if known	O or HM	Amount or Concentration	Units	RCs Exceeded, if Applicable (RCS-1, RCS-2,RCGW-1, RCGW-2)

☐ Check here if a list of additional Oil and Hazardous Materials subject to reporting, or any other documentation relating to this notification is attached.

D. PERSON REQUIRED TO NOTIFY:

1. Check all that apply: ☐ a. change in contact name ☐ b. change of address ☐ c. change in the person notifying

2. Name of Organization: CITY OF AMESBURY

3. Contact First Name: KASSANDRA 4. Last Name: GOVE

5. Street: 62 FRIEND STREET 6. Title:

7. City/Town: AMESBURY 8. State: MA 9. ZIP Code: 019130000

10. Telephone: 978-388-8121 11. Ext.: 12. Email: GoveK@AmesburyMA.Gov

☐ 13. Check here if attaching names and addresses of owners of properties affected by the Release or Threat of Release, other than an owner who is submitting this Release Notification (required).

E. RELATIONSHIP OF PERSON TO RELEASE OR THREAT OF RELEASE: ☐ Check here to change relationship

☑ 1. RP or PRP ☐ a. Owner ☐ b. Operator ☐ c. Generator ☐ d. Transporter

☑ e. Other RP or PRP Specify: NON-SPECIFIED PRP

☐ 2. Fiduciary, Secured Lender or Municipality with Exempt Status (as defined by M.G.L. c. 21E, s. 2)

☐ 3. Agency or Public Utility on a Right of Way (as defined by M.G.L. c. 21E, s. 5(j))

☐ 4. Any Other Person Otherwise Required to Notify Specify Relationship:

F. CERTIFICATION OF PERSON REQUIRED TO NOTIFY:

1. I, KEVIN J KAVANAUGH, attest under the pains and penalties of perjury (i) that I have personally examined and am familiar with the information contained in this submittal, including any and all documents accompanying this transmittal form, (ii) that, based on my inquiry of those individuals immediately responsible for obtaining the information, the material information contained in this submittal is, to the best of my knowledge and belief, true, accurate and complete, and (iii) that I am fully authorized to make this attestation on behalf of the entity legally responsible for this submittal. I/the person or entity on whose behalf this submittal is made am/is aware that there are significant penalties, including, but not limited to, possible fines and imprisonment, for willfully submitting false, inaccurate, or incomplete information.

2. By : KEVIN J KAVANAUGH (Signature) 3. Title: _____

4. For: CITY OF AMESBURY (Name of person or entity recorded in Section D) 5. Date : 9/17/2020 (mm/dd/yyyy)

☐ 6. Check here if the address of the person providing certification is different from address recorded in Section D.

7. Street: _____

8. City/Town: _____ 9. State: _____ 10. ZIP Code: _____

11. Telephone: _____ 12. Ext.: _____ 13. Email: _____

YOU ARE SUBJECT TO ANNUAL COMPLIANCE ASSURANCE FEES FOR EACH BILLABLE YEAR FOR TIER CLASSIFIED DISPOSAL SITES. YOU MUST LEGIBLY COMPLETE ALL RELEVANT SECTIONS OF THIS FORM OR DEP MAY RETURN THE DOCUMENT AS INCOMPLETE. IF YOU SUBMIT AN INCOMPLETE FORM, YOU MAY BE PENALIZED FOR MISSING A REQUIRED DEADLINE.

Date Stamp (DEP USE ONLY:)

Re: LSP Authorized Signature for MassDEP RTN 3-36397
Charles C. Cashman Elementary School
193 Lions Mouth Road
Amesbury, MA 01913

To Whom It May Concern:

As Mayor of the City of Amesbury, I authorize Kevin J. Kavanaugh, LSP, CHMM for Environmental & Construction Management Services, Inc. (ECMS) to sign and hereby submit Bureau of Waste Site Cleanup (BWSC) forms in eDEP as necessary on my behalf for the release of petroleum at 193 Lion's Mouth Road, Amesbury, MA as listed as Massachusetts Department of Environmental Protection (MassDEP) Release Tracking Number (RTN) 3-36397.

Sincerely,

Kassandra Gove (KG)

Kassandra Gove
Mayor

Braintree, MA 02184
Contact: Kevin Kavanaugh

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Search Results:

COPY OF RELEASE LOG FORM (RLF) BWSC-101

Massachusetts Department of Environmental Protection
Bureau of Waste Site Cleanup

RELEASE LOG FORM

BWSC 101

Release Tracking Number
3 - 36397

A. THIS FORM IS BEING USED TO: (check one)

1. Log Date: 7/24/2020 (mm/dd/yyyy) Log Time: 01:57 (hh:mm) ☐ AM ☑ PM

☑ 2. Assign a Release Tracking Number (RTN) to a Release or TOR Report.
- ☑ a. **Reportable Release or TOR.**
- ☐ b. **Release that is Less Than the Reporting Thresholds.**

☐ 3. Amend a Previously Recorded Release or TOR Report (RTN Assigned) .
- ☐ a. The Release is a **Reportable Release or TOR.**
- ☐ b. The Release is a **Release that is Less Than the Reporting Thresholds.**
- ☐ c. The Release or TOR is **Retracted**. (BWSC103 must be submitted, as well)
- ☐ d. The Release or TOR is **not a Release under M.G.L. c. 21E.**

B. REPORTING PERSON:

1. Name of Organization: ENVIRONMENTAL & CONSTRUCTION MANAGEMENT SERVICES
2. First Name: KEVIN
3. Last Name: KAVANAUGH
4. Telephone: 6172129255
5. Ext.:
6. Relationship of Person to Release: ☐ PRP ☑ Other c. Type, if known (e.g. Current Owner): Licensed Site Professional

C. RELEASE OR THREAT OF RELEASE (TOR) /SITE LOCATION:

1. Location Aid/Site Name: CHARLES C. CASHMAN ELEMENTARY SCHOOL
2. Street Address: 193 LIONS MOUTH ROAD
3. 2nd Address Line:
4. City/Town: AMESBURY, AMESBURY
5. Zip Code (if known): 019130000
6. Type of Location: (check all that apply) ☑ a. School ☐ b. Water Body ☐ c. Right of Way ☐ d. Utility Easement ☐ e. Roadway ☐ f. Municipal ☐ g. State ☐ h. Residential ☑ i. Open Space ☐ j. Private Property ☐ k. Industrial ☐ l. Commercial ☐ m. Federal ☐ n. Other Describe:

D. RELEASE OR TOR INFORMATION:

1. Date and Time of **Notification**: 7/24/2020 (mm/dd/yyyy) Time: 01:57 (hh:mm) ☐ AM ☑ PM
2. Date and Time Reporting Person obtained **Knowledge of Release or TOR**: 7/24/2020 (mm/dd/yyyy) Time: 12:00 (hh:mm) ☐ AM ☑ PM
3. Date and Time **Release or TOR occurred**, if known: (mm/dd/yyyy) Time: (hh:mm) ☐ AM ☐ PM
4. **Sources of the Release or TOR**: (check all that apply) ☐ a. Transformer ☐ b. Fuel Tank ☐ c. Pipe ☐ d. OHM Delivery ☐ e. AST ☐ f. Drums ☐ g. Tanker Truck ☐ h. Hose ☐ i. Line ☐ j. UST Describe ☐ k. Vehicle ☐ l. Boat/Vessel ☐ m. Unknown ☑ n. Other: UNDER INVESTIGATION
5. **Federal LUST Eligible**: ☐ Yes ☑ No ☐ Unknown

Check all Notification Thresholds that apply to the Release or TOR:

6. 2 Hour Reporting Conditions:

- ☐ a. Sudden Release
- ☐ b. Threat of Sudden Release
- ☐ c. Oil Sheen on Surface Water
- ☐ d. Poses Imminent Hazard
- ☑ e. Could Pose Imminent Hazard
- ☐ f. Release Detected in Private Well
- ☐ g. Release to Storm Drain
- ☐ h. Sanitary Sewer Release (Imminent Hazard Only)

7. 72 Hour Reporting Conditions:

- ☐ a. Subsurface Non-Aqueous Phase Liquid (NAPL) Equal to or Greater than 1/2 Inch
- ☐ b. Underground Storage Tank (UST) Release
- ☐ c. Threat of UST Release
- ☐ d. Release to Groundwater near Water Supply
- ☐ e. Release to Groundwater near School or Residence
- ☐ f. Substantial Release Migration

8. 120 Day Reporting Conditions:

- ☐ a. Release of Hazardous Material(s) to Soil or Groundwater Exceeding Reportable Concentration(s)
- ☐ b. Release of Oil to Soil Exceeding Reportable Concentration(s) and Affecting More than 2 Cubic Yards
- ☐ c. Release of Oil to Groundwater Exceeding Reportable Concentration(s)
- ☐ d. Subsurface Non-Aqueous Phase Liquid(NAPL) Equal to or Greater than 1/8 Inch and Less than 1/2 Inch

9. Type of Release or TOR: (check all that apply) ☐ a. Dumping ☐ b. Fire ☐ c. AST Removal ☐ d. Overfill ☐ e. rupture ☐ f. Vehicle Accident ☐ g. Leak ☐ h. Spill ☐ i. Test Failure ☐ j. TOR Only ☐ k. UST Removal Describe ☐ l. Unknown ☑ m. Other: UNDER INVESTIGATION

10. Media Impacted and Receptors Affected: (check all that apply) ☐ a. Paved Surface ☐ b. Basement ☐ c. School ☐ d. Public Water Supply ☐ e. Surface Water ☐ f. Zone 2 ☐ g. Private Well ☐ h. Residence ☑ i. Soil ☐ j. Ground Water ☐ k. Sediments ☐ l. Wetland ☐ m. Storm Drain ☐ n. Indoor Air ☐ o. Air ☐ p. Soil Gas ☐ q. Sub-Slab Soil Gas ☐ r. Critical Exposure Pathway ☐ s. NAPL ☐ t. Unknown ☐ u. Others Specify:

11. List below the Oils (O) or Hazardous Materials (HM) that exceed their Reportable Concentration (RC) or Reportable Quantity (RQ) by the greatest amount.

☐ Check here if an amount or concentration is unknown or less than detectable.

O or HM Released	CAS Number, if known	O or HM	Amount or Concentration	Units	RCs Exceeded, if Applicable
ARSENIC		HM	82.3	MG/KG	N/A
					N/A
					N/A

12. Description of Release or Threat of Release (if additional space is needed, attach additional information in H17)

LSP KAVANAUGH REPORTED THAT HE MEASURE ELEVATED LEVELS OF ARSENIC UP TO 82.3 MG/KG IN SOIL FROM ZERO TO TWELVE INCHES AT THE CHARLES C. CASHMAN ELEMENTARY SCHOOL 193 LIONS MOUTH ROAD IN AMESBURY. HE STATED THAT THE ARSENIC IS FOUND IN THE FIELDS OF THE ELEMENTARY SCHOOL. HE INDICATED THAT THE SCHOOL IS CURRENTLY VACANT HOWEVER THE FIELDS ARE BEING USED FOR SOCIAL ACTIVITIES. HE INDICATED THAT FURTHER IRA ASSESSMENT IS NEEDED TO HELP DETERMINE THE NATURE AND EXTENT OF THIS RELEASE.

E. INVOLVED PARTIES SUMMARY :

1. PRP Status (check one): ☐ a. PRP Unknown ☐ b. PRP unwilling, unable or has not committed to Perform Response Actions
☑ c. PRP Performing Response Actions ☐ d. Release is Adequated Regulated by the US Coast Guard

2. If PRP is not Performing Response Actions, who is?

☐ a. MassDEP State Contractor ☐ b. Other Person

3. Contractor:	a. Name of Organization:		b. Telephone:	
	c. Contact First Name:		d. Last Name:	
4. LSP:	a. Name:	KAVANAUGH KEVIN J	b. LSP #:	7610
	c. Telephone:	6173382121		

F. PRP OR PERSON PERFORMING RESPONSE ACTIONS:

1. Name of Organization: CITY OF AMESBURY, CITY HALL
2. Contact First Name: MAYOR KASSANDRA
3. Last Name: GOVE
4. Street: 62 FRIEND STREET
5. Title: MAYOR
6. City/Town: AMESBURY
7. State: MA
8. ZIP Code: 019130000
9. Telephone: 9783888121
10. Ext:
11. Email: GoveK@AmesburyMA.Gov
12. Relationship of Person to Release: ☑ PRP ☐ Other c. Type (e.g. Current Owner): Non-specified PRP

☐ 13. Check here if this PRP received a field NOR ☑ 14. Check here if an RNF was requested from this PRP

☑ 15. Check here if Provisions of 21E were explained to this PRP.

G. RECORD ORAL RESPONSE ACTIVITIES:

☐ 1. IRA Completed Pre-notification
☐ 2. No IRA Approved at Notification
☐ 3. IRA Assessment Only.
☑ 4. IRA Oral Plan Approved
☐ 5. IRA Oral Modified Plan Approved
☐ 6. IRA Oral Plan Denied and/or Request for Written Plan
☐ 7. Notice of Intent to Conduct a URAM
☐ 8 IRA-D Oral Plan Approved
☐ 9. IRA-D Oversight Work Started

10. Date of Action: 7/24/2020

11. Soil Previously Excavated: ☐ a. Excavated prior to notification. ☐ b. Excavated as part of an UST closure.

c. Quantity of contaminated soil previously excavated and destination, if applicable:

12. Specify any Regional Specific Code (Regional Use):

H. ORAL RESPONSE ACTION PLAN: (check all that apply)

☐ 1. Assessment and/or Monitoring Only
☑ 2. Temporary Covers or Caps
☐ 3. Deployment of Absorbent or Containment Materials
☐ 4. Temporary Water Supplies
☐ 5. Structure Venting System
☐ 6. Temporary Evacuation or Relocation of Residents
☐ 7. Product or NAPL Recovery
☑ 8. Fencing and Sign Posting
☐ 9. Groundwater Treatment Systems
☐ 10. Soil Vapor Extraction
☐ 11. Bioremediation
☐ 12. Air Sparging
☐ 13. Excavation of Contaminated Soils

☐ a. Re-use, Recycling or Treatment ☐ i. On Site ☐ ii. Off Site Authorized volume in cubic yards:
☐ b. Store ☐ i. On Site ☐ ii. Off Site Authorized volume in cubic yards:
☐ c. Landfill ☐ i. Cover ☐ ii. Disposal Authorized volume in cubic yards:

☐ 14. Removal of Drums, Tanks or Containers:

Describe Quantity and Amount: _____

☐ 15. Removal of Other Contaminated Media:

Specify Type and Volume: _____

☑ 16 Other Response Actions and Additional Comments (describe):

I PROVIDED ORAL IRA APPROVAL TO LSP KAVANAUGH AND RECOMMENDED INSTALLATION OF RESTRICTIVE FENCING, POSTING WARNING SIGNAGE, AND COVERING EXPOSED SOIL WITH POLYETHYLENE SHEETING. IRA ASSESSMENT MUST BE PERFORMED TO DETERMINE THE NATURE AND EXTENT OF THIS RELEASE. 21E RESPONSIBILITIES AND THE NEED TO SUBMIT A RELEASE NOTIFICATION FORM TO MASSDEP IN SIXTY DAYS WERE EXPLAINED TO LSP KAVANAUGH ON BEHALF OF THE CITY OF AMESBURY.

☐ 17. Check here if Additional Information is Provided in an Attachment

I. DEP STAFF AND FORM PREPARER:

1. DEP Staff: a. Name: GIDDINGS PAUL ☐ b. Check here, if Unassigned (or staff name not applicable).

2 . Preparer : a. Name: SANDERSON KENNETH

b. Signature: KENNETH SANDERSON c. Date: 7/24/2020

APPENDIX F

COPY OF RELEASE NOTIFICATION FORM (RNF) BWSC-103

Massachusetts Department of Environmental Protection
Bureau of Waste Site Cleanup

RELEASE NOTIFICATION & NOTIFICATION RETRACTION FORM

Pursuant to 310 CMR 40.0335 and 310 CMR 40.0371 (Subpart C)

BWSC 103

Release Tracking Number
3 - 36397

A. RELEASE OR THREAT OF RELEASE LOCATION:

1. Release Name/Location Aid: CHARLES C. CASHMAN ELEMENTARY SCHOOL
2. Street Address: 193 LIONS MOUTH ROAD
3. City/Town: AMESBURY 4. ZIP Code: 019130000
5. Coordinates: a. Latitude: N 42.85723 b. Longitude: W 70.94835

B. THIS FORM IS BEING USED TO: (check one)

- [x] 1. Submit a **Release Notification**
- [ ] 2. Submit a **Revised Release Notification**
- [ ] 3. Submit a **Retraction of a Previously Reported Notification** of a release or threat of release including supporting documentation required pursuant to 310 CMR 40.0335 (Section C is not required)

(All sections of this transmittal form must be filled out unless otherwise noted above)

C. INFORMATION DESCRIBING THE RELEASE OR THREAT OF RELEASE (TOR):

1. Date and time of Oral Notification, if applicable: 7/24/2020 (mm/dd/yyyy) Time: 01:57 (hh:mm) [ ] AM [x] PM
2. Date and time you obtained knowledge of the Release or TOR: 7/24/2020 (mm/dd/yyyy) Time: 12:00 (hh:mm) [ ] AM [x] PM
3. Date and time release or TOR occurred, if known: (mm/dd/yyyy) Time: (hh:mm) [ ] AM [ ] PM

Check all Notification Thresholds that apply to the Release or Threat of Release:
(for more information see 310 CMR 40.0310 - 40.0315)

4. 2 HOUR REPORTING CONDITIONS

- [ ] a. Sudden Release
- [ ] b. Threat of Sudden Release
- [ ] c. Oil Sheen on Surface Water
- [ ] d. Poses Imminent Hazard
- [x] e. Could Pose Imminent Hazard
- [ ] f. Release Detected in Private Well
- [ ] g. Release to Storm Drain
- [ ] h. Sanitary Sewer Release (Imminent Hazard Only)

5. 72 HOUR REPORTING CONDITIONS

- [ ] a. Subsurface Non-Aqueous Phase Liquid (NAPL) Equal to or Greater than 1/2 Inch (.04 feet)
- [ ] b. Underground Storage Tank (UST) Release
- [ ] c. Threat of UST Release
- [ ] d. Release to Groundwater near Water Supply
- [ ] e. Substantial Release Migration

6. 120 DAY REPORTING CONDITIONS

- [x] a. Release of Hazardous Material(s) to Soil or Groundwater Exceeding Reportable Concentration(s)
- [ ] b. Release of Oil to Soil Exceeding Reportable Concentration(s) and Affecting More than 2 Cubic Yards
- [ ] c. Release of Oil to Groundwater Exceeding Reportable Concentration(s)
- [ ] d. Subsurface Non-Aqueous Phase Liquid (NAPL) Equal to or Greater than 1/8 Inch (.01 feet) and Less than 1/2 Inch (.04 feet)

C. INFORMATION DESCRIBING THE RELEASE OR THREAT OF RELEASE (TOR): (cont.)

7. List below the Oils (O) or Hazardous Materials (HM) that exceed their Reportable Concentration (RC) or Reportable Quantity (RQ) by the greatest amount.

☐ Check here if an amount or concentration is unknown or less than detectable.

O or HM Released	CAS Number, if known	O or HM	Amount or Concentration	Units	RCs Exceeded, if Applicable (RCS-1, RCS-2,RCGW-1, RCGW-2)
ARSENIC		HM	82.3	MG/KG	RCS-1

☐ Check here if a list of additional Oil and Hazardous Materials subject to reporting, or any other documentation relating to this notification is attached.

D. PERSON REQUIRED TO NOTIFY:

1. Check all that apply: ☐ a. change in contact name ☐ b. change of address ☑ c. change in the person notifying

2. Name of Organization: CITY OF AMESBURY

3. Contact First Name: KASSANDRA 4. Last Name: GOVE

5. Street: 62 FRIEND STREET 6. Title: MAYOR

7. City/Town: AMESBURY 8. State: MA 9. ZIP Code: 019130000

10. Telephone: 978-388-8121 11. Ext.: 12. Email: govek@amesburyma.gov

☐ 13. Check here if attaching names and addresses of owners of properties affected by the Release or Threat of Release, other than an owner who is submitting this Release Notification (required).

E. RELATIONSHIP OF PERSON TO RELEASE OR THREAT OF RELEASE: ☐ Check here to change relationship

☑ 1. RP or PRP ☑ a. Owner ☐ b. Operator ☐ c. Generator ☐ d. Transporter

☐ e. Other RP or PRP Specify:

☐ 2. Fiduciary, Secured Lender or Municipality with Exempt Status (as defined by M.G.L. c. 21E, s. 2)

☐ 3. Agency or Public Utility on a Right of Way (as defined by M.G.L. c. 21E, s. 5(j))

☐ 4. Any Other Person Otherwise Required to Notify Specify Relationship:

F. CERTIFICATION OF PERSON REQUIRED TO NOTIFY:

1. I, KEVIN J KAVANAUGH, attest under the pains and penalties of perjury (i) that I have personally examined and am familiar with the information contained in this submittal, including any and all documents accompanying this transmittal form, (ii) that, based on my inquiry of those individuals immediately responsible for obtaining the information, the material information contained in this submittal is, to the best of my knowledge and belief, true, accurate and complete, and (iii) that I am fully authorized to make this attestation on behalf of the entity legally responsible for this submittal. I/the person or entity on whose behalf this submittal is made am/is aware that there are significant penalties, including, but not limited to, possible fines and imprisonment, for willfully submitting false, inaccurate, or incomplete information.

2. By : KEVIN J KAVANAUGH (Signature) 3. Title: MAYOR

4. For: CITY OF AMESBURY (Name of person or entity recorded in Section D) 5. Date : 7/31/2020 mm/dd/yyyy

☐ 6. Check here if the address of the person providing certification is different from address recorded in Section D.

Principal Environmental Scientist

1.0 INTRODUCTION

An Imminent Hazard Evaluation (IHE) is presented in this report for the Cashman Elementary School, located at 193 Lions Mouth Road in Amesbury, Massachusetts [Release Tracking Number (RTN) 3-31833]. This IHE was performed in accordance with requirements of the Massachusetts Contingency Plan (MCP, 310 CMR 40.0000) and other relevant guidance developed by the Massachusetts Department of Environmental Protection (MassDEP).

2.0 PROPERTY DESCRIPTION

2.1 Location and Legal Description of the Site

The Site is an irregularly-shaped 35.32-acre parcel of land located at 193 Lions Mouth Road in Amesbury, Essex County, Massachusetts 01913. According to the City of Amesbury Assessor, the property is listed as parcel 50/6. The Site is occupied by the Charles C. Cashman Elementary School and associated athletic fields, playground, parking lots and landscaped areas. Refer to Figure 2 entitled Lot Location Plan.

The Site is depicted on the 7.5 x 15-minute U.S.G.S. topographic quadrangle for Newburyport, Massachusetts dated 1987. The Universal Transverse Mercator (UTM) coordinates of the Site within zone 19 are approximately 4,746,558 meters north latitude and 340,818.9 meters east longitude or 42° 51' 26.06'' north latitude and 70° 56' 54.07'' west longitude. Elevation at the site is approximately 105 feet above mean sea level (amsl). Figure 1 includes both a Site Locus Plan and a Street Location Map of the Site. The Site and surrounding properties are shown on Figure 2, Lot Location Plan attached to this report.

2.2 Site and Vicinity Characteristics

The Site is currently occupied by the City of Amesbury Cashman Elementary School housing grades Pre-kindergarten through 4 (approximately 458 children). The Site is located within OSC – Open Space Conservancy. The school building is surrounded by a driveway and associated paved parking lots, a playground area and grass athletic field. Woodsom Farm to the west, and is accessed from Lions Mouth Road to the South. The north edge of the site is steeply sloping forested hill with an intermittent steam at the base. The Site is surrounded with pockets of densely settled residential neighborhoods.

No existing commercial printing facilities, gasoline filling/service stations, industrial properties or fuel depots were identified in the immediate vicinity of the

subject site. The past uses of these surrounding properties do not pose recognized environmental concerns to the Site.

2.3 Descriptions of Structures, Roads, Other Improvements on the Site

The 2-story school building is 61,472 gross square feet (GSF). The building is constructed of masonry block with brick veneer on slab on grade construction.

Assessor Office records indicate that the main Site building construction was completed in 1975. The school building is currently heated by natural gas and heated through forced air ducts. The roof is asphalt and on the roof are several HVAC units. Records indicate, the building is and always has been heated by natural gas. A copy of the Assessor Property Card is attached as Appendix D.

The nearest surface water bodies to the Site is Lake Gardner that is located approximately 2,500 feet to the north-northeast. According to the City of Amesbury Health Department, there are no know public or private potable water supply wells in the vicinity of the Site.

The City of Amesbury obtains its drinking water from its watershed area that encompasses about 55 square miles; most of which reside in New Hampshire. Tuxbury Pond feeds the Powow River, which the treatment plant draws from. Lake Attitash and Meadowbrook also supplement the water source seasonally and in times of drought. All of Amesbury's wastewater empties into their municipal sewer system. The wastewater treatment facility is located at 19 Merrimac Street.

The site is currently supplied with natural gas and serviced by the municipal water and sewer systems.

The existing school building has a sewage ejector system that was observed along the entrance driveway area south of the school.

2.4 Site Ownership

According to City of Amesbury Assessor's records, the subject site is owned by the City of Amesbury as of December 30, 1971 (Book 5833, Page 124).

A Title Search was not supplied to *ECMS*, and therefore additional ownership information was not available.

2.5 Current Uses of the Site

The Site is currently utilized as the City of Amesbury Cashman Elementary School for grades Pre-K through Grade 4.

2.6 Current Uses of Surrounding Properties

The Site is located within an area primarily used for single-family residential homes, farmland and undeveloped wooded vacant land. There were no visual indications observed during *ECMS* visual inspection of nearby or abutting properties of conditions that would indicate a release or threat of release of oil and/or hazardous substances on, at, in, or to the Site.

2.7 Past Uses of the Site and Vicinity

Historical information was obtained from a review of the historical topographs (1932, 1934, 1943, 1944, 1947, 1950, 1956, 1952, 1968, 1973, 1979, 1971, 1985, 1987 and 2012), historical aerial photos (1953, 1960, 1966, 1973, 1978, 1986, 1992, 1998, 2006, 2009, 2012 and 2016), City Directory (1961, 1965, 1968, 1973, 1977, 1982, 1987, 1992, 1995, 2000, 2005, 2010 and 2014). Refer to Appendix A for copies of the above historic documents.

The historical aerial photo from 1978 shows the school building. Prior to construction of the school building, the Site land area was undeveloped and appears to be farmland as depicted in the aerial photographs from 1953 through 1973.

Properties surrounding the Site to the north, south, east and west were developed with sporadic residential properties and some may have been farmland.

The past uses of these surrounding properties do not pose recognized environmental concerns to the Site.

3.0 EVALUATION OF IMMINENT HAZARDS

The purpose of an IHE is to evaluate whether an immediate response action (IRA) is needed to control or reduce short-term exposure to a release of oil and/or hazardous material while comprehensive investigations and response actions are being evaluated. The need for comprehensive response actions (i.e., the ultimate actions for the release) is determined (in part) by a Risk Characterization, which is performed after all site investigations are completed.

For this IHE *ECMS* engaged *Mr. Peter LaGoy of LaGoy Risk Analysis, Inc. (LaGoy)* in Hopkinton, Massachusetts as a professional risk assessor to evaluate the recently obtained soil sample analytical results for samples collected on July 9, 2020. Excerpts from the *LaGoy* "Evaluation of Soil Data from the Charles C. Cashman Elementary School, 193 Lions Mouth Road, Amesbury, Massachusetts dated July 27, 2020" and attached as Appendix A are included in the ECMS IHE presented herein.

The MCP requires that IHEs be conducted separately for human health, the environment, and safety. These evaluations are presented in the following subsections.

3.1 Human Health Imminent Hazard Evaluation

According to 310 CMR 40.0321(1)(d) and (f), a release of oil and/or hazardous material that poses a significant risk of harm to human health when present even for a short period of time, or a release to the environment that produces readily apparent effects to human health, including respiratory distress or dermal irritation, constitutes an imminent hazard. A short period of time is defined as five (5) years, unless site circumstances indicate that a shorter period of time is appropriate [40 CMR 40.0953(1)]. Human health IHEs consider actual or likely exposures of humans under current site conditions and uses (§40.0953). IHEs are expected to be conservative [(§40.0953(7)], to consider "hot spots" [§40.0953(4)], to focus on soil between 0 and 1 foot in depth [§40.0953(2)], and can focus on the constituents that are likely to dominate the IHE [§40.0953(5)].

The MCP and MassDEP guidance specify criteria for identifying the presence of an imminent hazard to human health. For non-carcinogenic constituents, the Hazard Index (HI) defining an imminent hazard is greater than:

- one (1) for oil or hazardous materials that have the potential to cause serious effects (including but not limited to lethal, developmental, or neurological effects) following short-term exposures; or
- ten (10) for all other oil or hazardous materials [MCP 310 CMR 40.0955(2)(c)(1)].

For carcinogenic constituents, the excess lifetime cancer risk defining an imminent hazard is:

- greater than a risk of 1 in 100,000 (denoted as 1x10-5) for a short exposure period (e.g., a 5-year exposure period) [MCP 310 CMR 40.0995(2)(b)]; and,
- greater than a risk of 1 in 10,000 (denoted as 1x10-4) over a long exposure period (MassDEP 1995).

3.1.1 Compounds of Concern (COCs)

The recent subject sampling event consisted of collecting 15 soil samples from beneath the grass (2-6 inches in depth), and two additional samples of slightly deeper soil (2 feet in depth). Soil was analyzed for the presence of metals, total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs, including the polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), and pesticides and herbicides. The results of the sampling are presented in Table 1 of Appendix A.

Only arsenic was present at a concentration above a reportable concentration. TPH was also detected in most samples (concentrations around 100 mg/kg) but could be present as a result of it use as a binder (waxes) in various lawn care products. Maximum metal concentrations were compared with expected concentrations in soil in Massachusetts (Table 2 of Appendix A), and chromium, nickel, and vanadium were present at levels above expected background. The four metals, arsenic, chromium, nickel, and vanadium will be considered in the imminent hazard calculations.

3.1.2 Receptors and Exposure Pathways

Potentially exposed humans at the site under current site use include children including students, non-student users of the playing fields and adults including commercial (school) workers, construction/utility workers (potentially), and visitors (including parents attending sporting event games). Because intermittently exposed individuals, such visitors, will be exposed to a lesser extent (shorter duration of exposure and/or less frequently) than students, non-student users of the playing field, and school workers, visitor exposure is not assessed. School worker exposure conservatively represents potential visitor exposure.

3.1.3 Exposure Point Concentrations

Students, school workers, and non-student users of the playing fields are assumed exposed only to shallow soil (depths of 0-1 foot), per MCP guidance for performing IHEs. The soil exposure point concentration (EPC) for arsenic in soil applied to the IHE is the 95th percentile upper confidence limit (95% UCL) of the mean concentration of arsenic in shallow soil.

Construction/utility workers are assumed exposed to both shallow and deeper soil, consistent with the type of activities (e.g., soil excavation) potentially performed. The soil EPC for arsenic is the 95% UCL of the mean concentration of arsenic in shallow and deeper soil.

Maximum concentrations were used as EPCs for chromium, nickel, and vanadium. For this site, concentrations of arsenic in shallow soil were detected in a narrow range (21.9 mg/kg – 82.3 mg/kg), and the 95% Upper Confidence Limit (UCL) calculated using the EPA's ProUCL model version 5.1 was used to calculate an EPC of 46.4 mg/kg for arsenic, based on a normal distribution of data and the Student t-test.

3.1.4 Quantitative Exposure Assessment

In general, individuals are exposed to materials released into the environment in varying quantities and proportions via a wide variety of possible exposure routes. The actual amount of material to which an individual is exposed depends on the

individual's frequency, extent, and duration of exposure, which in turn depend on many factors, including location of residence, age, body weight, sex, and activity patterns. Patterns of exposure are highly variable among individuals. This large potential variation in exposure to environmental conditions implies that a certain amount of uncertainty is inherent in risk assessment. This exposure assessment uses standard approaches and assumptions that are designed to be health protective, i.e., they are designed to produce estimates of exposure that overestimate, rather than underestimate, actual exposure and risk.

The purpose of a quantitative exposure assessment is to estimate the Chronic Daily Intake (CDI) of each contaminant of concern by an individual for each exposure route. For carcinogens, the CDI is averaged over the full lifetime (by convention, assumed to be 70 years; MassDEP 2008) and is termed the Lifetime Average Daily Dose or LADD for oral and dermal exposures. For noncarcinogens, the dose is only averaged over the period of exposure and is noted as the Average Daily Dose or ADD for oral and dermal exposure.

Soil Exposure – Children

Children are at school 180 days per year, and can also use the school facilities during the summer (roughly 70 days; end of June to end of August) but will use the outdoor play fields for only a fraction of that time and for short periods. Very young children (less than 2 year of age) are considered unlikely to be present on a regular basis. For the purposes of this assessment, contact by children is assumed for 109 days per year, which is the outdoor time assumed by MassDEP (1994) in initially establishing the S-1 soil standards. Exposure for a third of a year to a single outdoor play area is unlikely but provides a conservative estimate of exposure potential. People who contact soil may be exposed to constituents present in the soil by direct contact and subsequent ingestion of contaminated soil or by dermal absorption of constituents in soils adhering to the skin. Younger children are of greatest concern for soil contact, and therefore, assessment of exposure to younger children can be used to conservatively evaluate the potential for risks to older students. For this IHE, children are estimated to weigh an average of 15 kg (33 lbs.) based on the median weight for 5-year-old children (the youngest age likely to be regularly out on their own) determined in the NHANES II study for the US population in 1980 (MassDEP 1994). USEPA has reviewed more current data and has indicated average weights for humans have increased since that study.

Soil Ingestion: Children in regular contact with site soil are estimated to ingest 100 mg of soil per day (MassDEP 2002). All constituents in soil are assumed to be as available from the soil as from the media used in the toxicity studies and, consequently, a relative absorption factor or RAF of one is used for these constituents. Using this assumption and the others noted above, the ADD and LADD for soil ingestion by children can be estimated using the formula:

$$ADD/LADD = \frac{CS \times IR \times RAF \times EF \times ED}{BW \times 106\ (mg/kg) \times AT}$$

Where:

ADD = Average daily intake of the constituent (mg/kg/day),
LADD= Lifetime average daily dose (mg/kg/day),
CS = Constituent concentration in soil (mg/kg),
IR = Soil ingestion rate (100 mg/day; MassDEP 1995),
RAF = Relative absorption factor (1),
EF = Frequency of ingestion (109 days/year; MassDEP 1995),
ED = Exposure Duration (5 years; MassDEP 1995),
BW = Body weight (15 kg; EPA 1989), and
AT = Averaging Time (365 days x 5 yrs. (ADD) or 365 x 70 (LADD) days).

The calculated ADD for children exposed to lead detected in soil at the property based on this equation is provided in Table 3 for ingestion exposure to the soil at the school.

Dermal Contact: Dermal exposure to constituents in soil can occur through direct physical contact with soil. The same assumptions as for soil ingestion are used, with the exceptions that in place of an ingestion rate, a soil adherence factor of 0.2 mg soil/cm2 of skin, an exposed skin surface area of 3000 cm2 (roughly a third of the body surface area for this age child; MassDEP 1994) and constituent-specific relative absorption factors were used. Using these assumptions, the ADD and LADD can be estimated using the formula:

$$ADD/LADD = \frac{CS \times AD \times SA \times RAF \times EF \times ED}{BW \times 106\ (mg/kg) \times AT}$$

Where:

ADD = Average daily intake of the constituent (mg/kg/day),
LADD= Lifetime average daily dose (mg/kg/day),
CS = Constituent concentration in soil (mg/kg),
AD = Soil adherence to skin (0.2 mg/cm2; MassDEP 1995),
SA = Exposed skin surface area (3000 cm2; MassDEP 1995),
RAF = Relative absorption factor (constituent-specific; MassDEP 2006),
EF = Frequency of contact (109 days/year),
ED = Exposure Duration (5 years),
BW = Body weight (15 kg; EPA 1989), and
AT = Averaging Time (365 days x 5 yrs. (ADD) or 365 days x 70 days (LADD)).

The calculated ADD for children exposed to lead in soil at the site based on this equation is provided in Table 3 for exposure via dermal contact to the soil EPCs.

While the primary purpose of this assessment is to calculate whether an imminent hazard exists, the same approach can be modified slightly to assess overall site risks, given the continued use of the school and playground for current purposes. The assumption that children are unlikely to use the facility for more than 109 days per year, and for more than 5 years seems likely, given the grades (pre-K to 4th) that currently use the school. However, as a conservative measure, risks are also assessed assuming that children play at the school for 100 days per year over the course of a 10-year period and that they weigh 24 kg (average body weight for 2-12 years) over this period. This exposure and risk are calculated in Table 4.

Soil Exposure - Adults

Adults that may use the area would include school landscape workers, teachers, and parents attending games. Of these groups, landscapers would be expected to have the highest potential for regular contact. In order to determine if such soil contact is safe, exposure and risks to landscapers were evaluated quantitatively, using the previously-established EPCs.

Landscapers who work site soil may be exposed to constituents present in the soil by direct contact and subsequent ingestion of contaminated soil or by dermal absorption of constituents in soils adhering to the skin. Workers may also be exposed to constituents that become airborne as a component of windborne dust. Exposure for these people is assumed to occur for 100 days over the course of a year, assuming that during the roughly 8-month landscaping season, these workers are outdoors roughly 3 days per week over the 240-day period. Adults are estimated to weigh 70 kg. It should be noted that these calculations are particularly conservative in that exposure estimates are compared with toxicity values designed to be protective for chronic (long-term) exposures; toxicity values for short-term exposure are generally lower by a factor of 10.

Soil Ingestion: Workers in frequent contact with site soil are estimated to ingest 100 mg of soil per day (MassDEP 2002) and this value will be used for landscape workers. Using these assumptions and the others noted above, the ADD and LADD for soil ingestion by workers can be estimated using the formula for soil ingestion noted above. The calculated ADD for the constituents in soil at the property based on this equation is provided in Table 5 in Appendix A for soil ingestion exposure to the site-wide exposure point concentration.

Dermal Contact: Dermal exposure to constituents in soil can occur through direct physical contact with soil. The same assumptions as for soil ingestion are used, with the exceptions that in place of an ingestion rate, a soil adherence factor of 0.29 mg soil/cm2 of skin, an exposed skin surface area of 3,500 cm^2, and constituent-specific relative absorption factors were used. Using these assumptions, the ADD and LADD can be estimated using the formula for dermal contact noted above. The calculated ADD for the constituents in soil at the property based on this equation is

provided in Table 5 in Appendix A for exposure via dermal contact to the EPCs in soil.

Inhalation. Although unlikely considering the small area of uncovered soil, landscapers could be exposed via inhalation to constituents entrained in soil-derived dust (MassDEP 2002). To estimate exposure, the same assumptions provided above for body weight, lifetime exposure duration and frequency were used. It was assumed that the gardener inhaled 20 cubic meters (m3) of air during the time on site (essentially equal to the daily inhalation rate of 20 m^3/day; EPA, 1989 and corresponding to a full workday at an average moderate to heavy level of exertion; MassDEP 1995a).

In order to evaluate the potential for inhalation exposure to constituents entrained in the dust, it is necessary to estimate the amount of dust that would be present in the air, and the amount of air inhaled during the period that dust is present in the air. MassDEP (2002) suggests a value of 60 ug/m^3 for excavations and this value will be used in this evaluation, which is a conservative approach since excavation work would be expected to generate more dust than gardening. The value of 60 ug/m3 is based on the assumption that gardeners will only receive intermittent exposure to visible dust but that the average exposure level will be above that used by EPA for undisturbed sites.

MassDEP notes that exposure to constituents on airborne particulates can occur through either direct inhalation or via inhalation followed by movement of the particles from the upper respiratory tract to the gastrointestinal tract. For direct inhalation, MassDEP indicates that only approximately half of the inhaled particulate matter will actually reach the lungs. However, for this evaluation, it is assumed that all the agent inhaled is of concern, as many inhaled constituents act at sites along the respiratory tract and do not need to reach the lungs to have adverse effects. For the inhalation-to-oral pathway, the ingested dose is estimated to be twice the measured PM10 dose of 60 ug/m3. However, the total soil intake via this pathway (2 x 60 ug/m3 x 20 m3/day x 1 mg/1000 ug = 2.4 mg soil) is so low as to not add significantly to the soil dose calculated for direct ingestion and is not considered further in this assessment.

Exposure can be calculated using the equation:

$$ADE/LADE = \frac{EPC \times IF \times PM10 \times RAF \times EF \times ED}{BW \times AT}$$

Where:

ADE = Average daily exposure to the constituent (mg/m3),
LADE= Lifetime average daily dose (mg/m3),
EPC = Constituent concentration in soil (mg/kg),
IF = Inhalation Fraction (20 m3 / 20 m3day; MassDEP 2002),
PM10 = Particulate air concentration (60 ug/m3; MassDEP 2002).

RAF = Relative absorption factor (1 used to be conservative),
EF = Frequency of contact (100 days/year),
ED = Exposure Duration (5 years), and
AT = Averaging Time (365 days x 5 or 70 years).

Table 5 in Appendix A provides the estimated exposure and risk values for inhalation exposure to an adult landscaper, assuming no dust suppression measures are implemented. Exposure to other site users, including teachers and parents, would be expected to be lower.

3.1.5 Human Health Imminent Hazard Evaluation Results

Using the EPCs, exposure factors, and toxicity values discussed above, and using conventional risk characterization models, imminent hazard calculations were performed. The calculations are contained in *LaGoy Risk Analysis, Inc. (LaGoy)* "Evaluation of Soil Data from the Charles C. Cashman Elementary School, 193 Lions Mouth Road, Amesbury, Massachusetts dated July 27, 2020" and attached as Appendix A.

For noncarcinogenic (systemic) effects, EPA and MassDEP assume that there is a level below which no effects will occur (a threshold no effect concentration). To evaluate possible risk from exposure to noncarcinogenic contaminants, the average daily dose (ADD) is divided by the health criterion value [the reference dose (RfD)]. If the ADD:RfD ratio, also termed the hazard index or HI, is less than ten for all constituents (i.e., if the daily intake is below the health criterion), then the contaminant is considered unlikely to pose an Imminent Hazard (i.e., a significant risk under conditions of short-term exposure) to individuals exposed under the given scenario. If the HI is less than ten, the site does not pose an Imminent Hazard. For cancer risk, the exposure, termed the lifetime average daily dose or LADD is multiplied by the cancer slope factor to estimate cancer risk, and this risk is compared with a target risk level of 1 in 100,000 or 10-5.

Imminent hazards associated with short term exposure to site constituents in soil are estimated in Table 3 for children and in Table 5 for landscapers (and other adults). Based on these calculations, exposure by children to soil concentrations of site constituents results in a hazard index of 0.5 (soil ingestion plus dermal absorption risks combined) and a cancer risk of 1 x 10-5. Exposure by adults to soil concentrations of site constituents results in a hazard index of 0.08 (soil ingestion, dermal absorption, and inhalation exposures combined) and a cancer risk of 3 x 10-6. These levels do not exceed the Imminent Hazard criterion of an HI of ten and a cancer risk level of 10^{-5}, indicating that continued use of this site does not pose an imminent hazard.

Hazards and risks associated with longer term exposure to site constituents in soil are estimated in Table 4 in Appendix A for children and in Table 6 in Appendix A for

landscapers (and other adults). Based on these calculations, exposure by children to soil concentrations of site constituents results in a hazard index of 0.3 and a cancer risk of 1 x 10-5. Exposure by adults to soil concentrations of site constituents results in a hazard index of 0.08 and a cancer risk of 1×10^{-5}. These levels do not exceed the long-term risk targets of a cancer risk of 10^{-5} and an HI of 1, indicating that continued long term exposure at these concentrations would not pose a significant risk.

Based on these results, an imminent hazard to human health does not exist at the site.

3.2 Environmental Imminent Hazard Evaluation

The site property is developed for educational use and is partially paved or built on and partially uncovered. The developed areas of the site possess little potential environmental habitat because of human use; however, undeveloped portions of the site may serve as habitat for native flora and fauna. According to 40 CMR 40.0955(3), the following conditions constitute an imminent hazard to the environment:

- evidence of stressed biota attributable to the release at the disposal site, including, without limitation, fish kills or abiotic conditions; or

- a release to the environment of oil or hazardous material which produces immediate or acute adverse impacts to freshwater or saltwater fish populations.

No such conditions are known to exist as a result of arsenic in site soil. Therefore, it is concluded that the site poses no imminent hazard to the environment.

3.3 Safety Imminent Hazard Evaluation

An imminent hazard to safety is evaluated by identifying conditions that could pose a threat of physical harm or bodily injury to existing receptors under current site conditions. Examples include the presence of an explosive environment or insecurely containerized waste.

No conditions representative of an imminent hazard to safety exist on the site. Based on these factors, it is concluded that no imminent hazard to safety exists at the site.

4.0 SUMMARY, CONCLUSION & RECOMMENDATIONS

An IHE was performed for the presence of arsenic in soil of the Cashman school property. The IHE examined potential imminent hazards to the health of students, non-student users of the playing fields, commercial (school) workers, and construction/utility workers not protected by conditions of an adequate Health and Safety Plan. The IHE also evaluated potential imminent hazards to the environment and safety. The IHE concludes the following:

- The site poses no imminent hazard to students, non-student users of the playing fields, school workers, and construction/utility workers.
- The site poses no imminent hazard to the environment.
- The site poses no imminent hazard to safety.

Soil was recently sampled by *ECMS* and analyzed with respect to the Cashman Elementary School property located at 193 Lions Mouth Road in Amesbury, Massachusetts. Arsenic and several other metals were detected at levels above a reportable concentration (arsenic) and above levels expected in background soil. However, no anthropogenic source of arsenic was present, the Amesbury area is known to have naturally-elevated arsenic levels in soil, and the source appears most likely to be natural. Further assessment will be required to determine if the source of arsenic detected on the Site is naturally occurring and presented with lines of evidence as part of the development of a Conceptual Site Model (CSM) for this "release". While the arsenic is assumed to be naturally occurring, calculations were performed to assess if a calculated risk was present for either short-term (IH) or longer-term exposure. Evaluation of the concentrations detected and of site-specific factors indicates that an Imminent Hazard condition does not exist at the site. Use of the site would also not pose a Significant Risks.

It should be noted that calculated risks did not exceed but were at the target risk levels. Therefore, although the area does not pose an Imminent Hazard or Significant Risk for current use, considering the use of the site as a school, it may be prudent to take measures to mitigate the potential for exposure. Such measures could include replacing natural soil in areas of exposed soil with imported soil containing lower levels of natural arsenic.

In order to ensure that public health is adequately protected, conservative assumptions (i.e., those unlikely to underestimate risk) were used in deriving both the exposure estimates and the toxicity values that are included in this letter report. Because of the use of these conservative assumptions, it is likely that the actual potential for non-cancer and cancer risks is lower than as is estimated in this report.

< indicates less than the respective method detection limit.
mg/kg = milligrams per kilogram
µg/kg = micrograms per kilogram
Bolfaced type indicates an exceedance.

< indicates less than the respective method detection limit.
mg/kg = milligrams per kilogram
µg/kg = micrograms per kilogram
Boldfaced type indicates an exceedance.

RE: Evaluation of Soil Data from the Charles C. Cashman Elementary School, 193 Lions Mouth Road, Amesbury, Massachusetts

Dear Kevin:

I reviewed the soil data collected by Environmental & Construction Management Services, Inc. (ECMS) on July 9, 2020, from the Charles C. Cashman Elementary School property at 193 Lions Mouth Road in Amesbury, Massachusetts. I understand that samples were collected from loam and shallow (2 feet deep) subsoil near an existing baseball field on the property.

Based on my review and using standard calculations following the methodology required by the Massachusetts Department of Environmental Protection (MassDEP), the detected constituents do not pose an Imminent Hazard under the Massachusetts Contingency Plan (MCP), which is the relevant state regulatory program. Using the average concentration of arsenic and the maximum value of other metals that were detected above state-wide background levels for natural soil in Massachusetts as an exposure point concentration (EPC; the level of a constituent that an individual could regularly contact) and site-specific exposure assumptions provided on children and adults likely to use this field, the constituents that were detected do not pose an Imminent Hazard. I would also note that the use does not pose a calculated Significant Risk as that term is defined under the MCP, and that the arsenic appears to be present as a result of its presence in native soil. Although the site does not pose an Imminent Hazard under the MCP, steps to reduce or eliminate the potential for contact with these constituents and the associated soil at the site may still be prudent from both a risk management and MCP perspective.

Initial Evaluation

The Cashman school property in Amesbury, Massachusetts consists of a roughly 35-acre parcel that is currently used for pre-K through 4th grade students. The results of explorations performed at the property indicate that fill material identified at the site contains varying amounts of ash and cinders and may also contain remnants of the former residential building that had occupied the property prior to the garden.

The recent subject sampling event consisted of collecting 15 soil samples from beneath the grass (2-6 inches in depth), and two additional samples of slightly deeper soil (2 feet in depth). Soil was analyzed for the presence of metals, total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs, including the polycyclic aromatic hydrocarbons (PAHs), and pesticides and herbicides. The results of the sampling are presented in Table 1.

Only arsenic was present at a concentration above a reportable concentration. TPH was also detected in most samples (concentrations around 100 mg/kg) but could be present as a result of it use as a binder (waxes) in various lawn care products. Maximum metal concentrations were compared with expected concentrations in soil in Massachusetts (Table 2), and chromium, nickel, and vanadium were present at levels above expected background. The four metals, arsenic, chromium, nickel, and vanadium will be considered in the imminent hazard calculations.

The source of the arsenic is site soils does not appear to be associated with anthropogenic use but rather as a result of naturally-elevated arsenic concentrations. While arsenic was used widely for industrial purposes (e.g., for preservation of hides in tanning; as a pesticide as lead arsenates) the past use of the property is not consistent with these uses, and if the arsenic was present as a result of agricultural pesticide use, lead levels would be expected to be higher. Amesbury is in an area of Massachusetts known to have naturally elevated arsenic levels and consequently, its present is considered most likely to be attributable to natural sources. As such, its presence would not be regulated under the MCP but considering its location at a school, further assessment is prudent.

Imminent Hazard Calculations

An Imminent Hazard Evaluation (IHE) performed in accordance with the MCP evaluates whether constituents that are detected at a site could pose a risk of harm to human health, safety, public welfare, and the environment under current site conditions or for a short period of time (5 years, unless site conditions indicate a shorter time period is appropriate). For this site, the constituent of greatest concern, arsenic appears to be present as a result of natural background, and as such does not pose an imminent hazard. However, because of the use of the property as a school, further calculations are warranted to determine if some mitigation of the presence of even these natural soils may be warranted.

An Imminent Hazard does not exist if the cumulative cancer risk calculated for the short time period is below one in one hundred thousand (1×10^{-5} or 1E-05), the "hazard index" is below ten (10) for most constituents or below one (1) for constituents that have the potential to cause serious effects (specifically lead and cyanide, per a discussion with Nancy Bettinger of MassDEP BWSC ORS in January 2007, and trichloroethylene, per a discussion with Paul Locke of MassDEP in November 2012) following short-term exposures, and the site does not pose a risk to safety, public welfare, or the environment based on a consideration of site conditions and applicable standards. The results of the Imminent Hazard Risk Characterization are used as the basis for a decision as to whether or not an Immediate Response Action is necessary at the site.

This Imminent Hazard Evaluation has been conducted to specifically evaluate metals detected in soil at the Cashman Elementary School in Amesbury, Massachusetts. The purpose of this evaluation is to determine if a calculated Imminent Hazard to human health, as defined by the MCP, currently exists for the area for short-term exposure. Past exposure is likely to have been similar, so this IHE also provides information about possible past risks associated with use of the area.

This IHE focuses on human health. A consideration of site conditions indicates that the presence of the identified constituents does not pose an Imminent Hazard to public welfare, the environment, or safety.

Toxicity Assessment

The toxicity values for the metals are presented in Tables 3 and 5. Further description of the toxicity of arsenic, the metal of primary concern, is presented below.

Arsenic is a metalloid that has been shown to cause skin, bladder, and perhaps other cancers in individuals exposed through drinking water from wells with high arsenic levels. Arsenic has also been associated with an increased risk of lung cancer in exposed workers. Chronic exposure to arsenic at high levels causes adverse effects on the gastrointestinal tract. In addition, there is some evidence that exposure causes polyneuropathy. EPA has established an oral reference dose of 0.0003 mg/kg/day and an inhalation reference concentration of 2.5×10^{-5} mg/m^3. EPA has also established an oral cancer potency factor of 1.5 $(mg/kg/day)^{-1}$ and an inhalation unit risk of 0.003 $(ug/m^3)^{-1}$ and MassDEP uses these values.

Exposure Evaluation

As part of an IHE, concentrations of constituents detected in accessible surface soil can be used to evaluate the potential for actual exposure and risk with respect to current site uses and activities. The MCP defines accessible surface soil as soil that extends to a depth of 6 inches below the ground surface. As noted in MassDEP guidance, for an IHE, the focus is on short term risks, and maximum concentrations are typically used in the assessment as exposure point concentrations (EPCs; the concentration an individual could be exposed to on a regular basis). Maximum concentrations were used as EPCs for chromium, nickel, and vanadium. For this site, concentrations of arsenic in shallow soil

were detected in a narrow range (21.9 mg/kg – 82.3 mg/kg), and the 95% Upper Confidence Limit (UCL) calculated using the EPA's ProUCL model version 5.1 was used to calculate an EPC of 46.4 mg/kg for arsenic, based on a normal distribution of data and the Student t-test.

Quantitative Exposure Assessment

In general, individuals are exposed to materials released into the environment in varying quantities and proportions via a wide variety of possible exposure routes. The actual amount of material to which an individual is exposed depends on the individual's frequency, extent, and duration of exposure, which in turn depend on many factors, including location of residence, age, body weight, sex, and activity patterns. Patterns of exposure are highly variable among individuals. This large potential variation in exposure to environmental conditions implies that a certain amount of uncertainty is inherent in risk assessment. This exposure assessment uses standard approaches and assumptions that are designed to be health protective, i.e., they are designed to produce estimates of exposure that overestimate, rather than underestimate, actual exposure and risk.

The purpose of a quantitative exposure assessment is to estimate the Chronic Daily Intake (CDI) of each contaminant of concern by an individual for each exposure route. For carcinogens, the CDI is averaged over the full lifetime (by convention, assumed to be 70 years; MassDEP 2008) and is termed the Lifetime Average Daily Dose or LADD for oral and dermal exposures. For noncarcinogens, the dose is only averaged over the period of exposure and is noted as the Average Daily Dose or ADD for oral and dermal exposure.

Soil Exposure - Children

Children are at school 180 days per year, and can also use the school facilities during the summer (roughly 70 days; end of June to end of August) but will use the outdoor play fields for only a fraction of that time and for short periods. Very young children (less than 2 year of age) are considered unlikely to be present on a regular basis. For the purposes of this assessment, contact by children is assumed for 109 days per year, which is the outdoor time assumed by MassDEP (1994) in initially establishing the S-1 soil standards. Exposure for a third of a year to a single outdoor play area is unlikely but provides a conservative estimate of exposure potential. People who contact soil may be exposed to constituents present in the soil by direct contact and subsequent ingestion of contaminated soil or by dermal absorption of constituents in soils adhering to the skin. Younger children are of greatest concern for soil contact, and therefore, assessment of exposure to younger children can be used to conservatively evaluate the potential for risks to older students. For this IHE, children are estimated to weigh an average of 15 kg (33 lbs) based on the median weight for 5-year-old children (the youngest age likely to be regularly out on their own) determined in the NHANES II study for the US population in 1980 (MassDEP 1994). USEPA has reviewed more current data and has indicated average weights for humans have increased since that study.

Soil Ingestion: Children in regular contact with site soil are estimated to ingest 100 mg of soil per day (MassDEP 2002). All constituents in soil are assumed to be as available

from the soil as from the media used in the toxicity studies and, consequently, a relative absorption factor or RAF of one is used for these constituents. Using this assumption and the others noted above, the ADD and LADD for soil ingestion by children can be estimated using the formula:

$$\text{ADD/LADD} = \frac{\text{CS x IR x RAF x EF x ED}}{\text{BW x } 10^6 \text{ (mg/kg) x AT}}$$

Where:

ADD	=	Average daily intake of the constituent (mg/kg/day),
LADD	=	Lifetime average daily dose (mg/kg/day),
CS	=	Constituent concentration in soil (mg/kg),
IR	=	Soil ingestion rate (100 mg/day; MassDEP 1995),
RAF	=	Relative absorption factor (1),
EF	=	Frequency of ingestion (109 days/year; MassDEP 1995),
ED	=	Exposure Duration (5 years; MassDEP 1995),
BW	=	Body weight (15 kg; EPA 1989), and
AT	=	Averaging Time (365 days x 5 yrs (ADD) or 365 x 70 (LADD) days).

The calculated ADD for children exposed to lead detected in soil at the property based on this equation is provided in Table 3 for ingestion exposure to the soil at the school.

Dermal Contact: Dermal exposure to constituents in soil can occur through direct physical contact with soil. The same assumptions as for soil ingestion are used, with the exceptions that in place of an ingestion rate, a soil adherence factor of 0.2 mg soil/cm^2 of skin, an exposed skin surface area of 3000 cm^2 (roughly a third of the body surface area for this age child; MassDEP 1994) and constituent-specific relative absorption factors were used. Using these assumptions, the ADD and LADD can be estimated using the formula:

$$\text{ADD/LADD} = \frac{\text{CS x AD x SA x RAF x EF x ED}}{\text{BW x } 10^6 \text{ (mg/kg) x AT}}$$

Where:

ADD	=	Average daily intake of the constituent (mg/kg/day),
LADD	=	Lifetime average daily dose (mg/kg/day),
CS	=	Constituent concentration in soil (mg/kg),
AD	=	Soil adherence to skin (0.2 mg/cm^2; MassDEP 1995),
SA	=	Exposed skin surface area (3000 cm^2; MassDEP 1995),
RAF	=	Relative absorption factor (constituent-specific; MassDEP 2006),
EF	=	Frequency of contact (109 days/year),
ED	=	Exposure Duration (5 years),
BW	=	Body weight (15 kg; EPA 1989), and
AT	=	Averaging Time (365 days x 5 yrs (ADD) or 365 days x 70 days (LADD)).

The calculated ADD for children exposed to lead in soil at the site based on this equation is provided in Table 3 for exposure via dermal contact to the soil EPCs.

While the primary purpose of this assessment is to calculate whether an imminent hazard exists, the same approach can be modified slightly to assess overall site risks, given the continued use of the school and playground for current purposes. The assumption that children are unlikely to use the facility for more than 109 days per year, and for more than 5 years seems likely, given the grades (pre-K to 4th) that currently use the school. However, as a conservative measure, risks are also assessed assuming that children play at the school for 100 days per year over the course of a 10-year period and that they weigh 24 kg (average body weight for 2-12 years) over this period. This exposure and risk are calculated in Table 4.

Soil Exposure - Adults

Adults that may use the area would include school landscape workers, teachers, and parents attending games. Of these groups, landscapers would be expected to have the highest potential for regular contact. In order to determine if such soil contact is safe, exposure and risks to landscapers were evaluated quantitatively, using the previously-established EPCs.

Landscapers who work site soil may be exposed to constituents present in the soil by direct contact and subsequent ingestion of contaminated soil or by dermal absorption of constituents in soils adhering to the skin. Workers may also be exposed to constituents that become airborne as a component of windborne dust. Exposure for these people is assumed to occur for 100 days over the course of a year, assuming that during the roughly 8-month landscaping season, these workers are outdoors roughly 3 days per week over the 240-day period. Adults are estimated to weigh 70 kg. It should be noted that these calculations are particularly conservative in that exposure estimates are compared with toxicity values designed to be protective for chronic (long-term) exposures; toxicity values for short-term exposure are generally lower by a factor of 10.

Soil Ingestion: Workers in frequent contact with site soil are estimated to ingest 100 mg of soil per day (MassDEP 2002) and this value will be used for landscape workers. Using these assumptions and the others noted above, the ADD and LADD for soil ingestion by workers can be estimated using the formula for soil ingestion noted above. The calculated ADD for the constituents in soil at the property based on this equation is provided in Table 5 for soil ingestion exposure to the site-wide exposure point concentration.

Dermal Contact: Dermal exposure to constituents in soil can occur through direct physical contact with soil. The same assumptions as for soil ingestion are used, with the exceptions that in place of an ingestion rate, a soil adherence factor of 0.29 mg soil/cm^2 of skin, an exposed skin surface area of 3500 cm^2, and constituent-specific relative

absorption factors were used. Using these assumptions, the ADD and LADD can be estimated using the formula for dermal contact noted above. The calculated ADD for the constituents in soil at the property based on this equation is provided in Table 5 for exposure via dermal contact to the EPCs in soil.

Inhalation. Although unlikely considering the small area of uncovered soil, landscapers could be exposed via inhalation to constituents entrained in soil-derived dust (MassDEP 2002). To estimate exposure, the same assumptions provided above for body weight, lifetime exposure duration and frequency were used. It was assumed that the gardener inhaled 20 cubic meters (m^3) of air during the time on site (essentially equal to the daily inhalation rate of 20 m^3/day; EPA, 1989 and corresponding to a full workday at an average moderate to heavy level of exertion; MassDEP 1995a).

In order to evaluate the potential for inhalation exposure to constituents entrained in the dust, it is necessary to estimate the amount of dust that would be present in the air, and the amount of air inhaled during the period that dust is present in the air. MassDEP (2002) suggests a value of 60 ug/m^3 for excavations and this value will be used in this evaluation, which is a conservative approach since excavation work would be expected to generate more dust than gardening. The value of 60 ug/m^3 is based on the assumption that gardeners will only receive intermittent exposure to visible dust but that the average exposure level will be above that used by EPA for undisturbed sites.

MassDEP notes that exposure to constituents on airborne particulates can occur through either direct inhalation or via inhalation followed by movement of the particles from the upper respiratory tract to the gastrointestinal tract. For direct inhalation, MassDEP indicates that only approximately half of the inhaled particulate matter will actually reach the lungs. However, for this evaluation, it is assumed that all the agent inhaled is of concern, as many inhaled constituents act at sites along the respiratory tract and do not need to reach the lungs to have adverse effects. For the inhalation-to-oral pathway, the ingested dose is estimated to be twice the measured PM_{10} dose of 60 ug/m^3. However, the total soil intake via this pathway (2 x 60 ug/m^3 x 20 m^3/day x 1 mg/1000 ug = 2.4 mg soil) is so low as to not add significantly to the soil dose calculated for direct ingestion and is not considered further in this assessment.

Exposure can be calculated using the equation:

$$ADE/LADE = \frac{EPC \times IF \times PM10 \times RAF \times EF \times ED}{BW \times AT}$$

Where:

ADE = Average daily exposure to the constituent (mg/m^3),
LADE= Lifetime average daily dose (mg/m^3),
EPC = Constituent concentration in soil (mg/kg),
IF = Inhalation Fraction (20 m^3 / 20 m^3day; MassDEP 2002),
PM10 = Particulate air concentration (60 ug/m^3; MassDEP 2002).
RAF = Relative absorption factor (1 used to be conservative),

EF	=	Frequency of contact (100 days/year),
ED	=	Exposure Duration (5 years), and
AT	=	Averaging Time (365 days x 5 or 70 years).

Table 5 provides the estimated exposure and risk values for inhalation exposure to an adult landscaper, assuming no dust suppression measures are implemented. Exposure to other site users, including teachers and parents, would be expected to be lower.

Health Risks at the Site

In this section, information concerning the potential levels of exposure to contaminants is combined with information concerning the toxicity of the contaminants in order to determine the potential health risks at the property. For noncarcinogenic (systemic) effects, EPA and MassDEP assume that there is a level below which no effects will occur (a threshold no effect concentration). To evaluate possible risk from exposure to noncarcinogenic contaminants, the average daily dose (ADD) is divided by the health criterion value [the reference dose (RfD)]. If the ADD:RfD ratio, also termed the hazard index or HI, is less than ten for all constituents (i.e., if the daily intake is below the health criterion), then the contaminant is considered unlikely to pose an Imminent Hazard (i.e., a significant risk under conditions of short-term exposure) to individuals exposed under the given scenario. If the HI is less than ten, the site does not pose an Imminent Hazard. For cancer risk, the exposure, termed the lifetime average daily dose or LADD is multiplied by the cancer slope factor to estimate cancer risk, and this risk is compared with a target risk level of 1 in 100,000 or 10^{-5}.

Imminent hazards associated with short term exposure to site constituents in soil are estimated in Table 3 for children and in Table 5 for landscapers (and other adults). Based on these calculations, exposure by children to soil concentrations of site constituents results in a hazard index of 0.5 (soil ingestion plus dermal absorption risks combined) and a cancer risk of 1×10^{-5}. Exposure by adults to soil concentrations of site constituents results in a hazard index of 0.08 (soil ingestion, dermal absorption, and inhalation exposures combined) and a cancer risk of 3×10^{-6}. These levels do not exceed the Imminent Hazard criterion of an HI of ten and a cancer risk level of 10^{-5}, indicating that continued use of this site does not pose an imminent hazard.

Hazards and risks associated with longer term exposure to site constituents in soil are estimated in Table 4 for children and in Table 6 for landscapers (and other adults). Based on these calculations, exposure by children to soil concentrations of site constituents results in a hazard index of 0.3 and a cancer risk of 1×10^{-5}. Exposure by adults to soil concentrations of site constituents results in a hazard index of 0.08 and a cancer risk of 1×10^{-5}. These levels do not exceed the long-term risk targets of a cancer risk of 10^{-5} and an HI of 1, indicating that continued long term exposure at these concentrations would not pose a significant risk.

A number of assumptions were used in deriving the exposure estimates and toxicity criteria. While there is some uncertainty in the resulting hazard and risk estimates, conservative (health protective) assumptions were made so actual hazards and risks are likely to be lower than the calculated hazards and risks.

Conclusions and Recommendations

Soil was recently sampled by ECMS and analyzed with respect to the Cashman Elementary School property located at 193 Lions Mouth Road in Amesbury, Massachusetts. Arsenic and several other metals were detected at levels above a reportable concentration (arsenic) and above levels expected in background soil. However, no anthropogenic source of arsenic was present, the Amesbury area is known to have naturally-elevated arsenic levels in soil, and the source appears most likely to be natural. While the arsenic is assumed to be naturally occurring, calculations were performed to assess if a calculated risk was present for either short-term (IH) or longer-term exposure. Evaluation of the concentrations detected and of site-specific factors indicates that an Imminent Hazard condition does not exist at the site. Use of the site would also not pose a Significant Risks.

It should be noted that calculated risks did not exceed but were at the target risk levels. Therefore, although the area does not pose an Imminent Hazard or Significant Risk for current use, considering the use of the site as a school, it may be prudent to take measures to mitigate the potential for exposure. Such measures could include replacing natural soil in areas of exposed soil with imported soil containing lower levels of natural arsenic.

In order to ensure that public health is adequately protected, conservative assumptions (i.e., those unlikely to underestimate risk) were used in deriving both the exposure estimates and the toxicity values that are included in this letter report. Because of the use of these conservative assumptions, it is likely that the actual potential for non-cancer and cancer risks is lower than as is estimated in this report.

If you have any questions, please give me a call.

Sincerely,

Peter K. LaGoy
Principal

QUALIFICATIONS/LIMITATIONS

QUALIFICATIONS/LIMITATIONS

Environmental & Construction Management Services, Inc. (ECMS) professional services have been performed, our findings obtained, and our recommendations prepared in accordance with customary principles and practices in the fields of environmental science and engineering. This warranty is in lieu of all other warranties either expressed or implied. *ECMS* is not responsible for the independent conclusions, opinions or recommendations made by others based on the records review, site inspection, field exploration, and laboratory test data presented in this report.

Factual information regarding on-site business operations, conditions, and historical data provided to *ECMS* is assumed to be correct and complete. *ECMS* assumes no responsibility for hidden or latent conditions or misrepresentation by the property owner, its representatives, public information officials or any authority consulted in connection with the compilation of this report.

The findings set forth in the attached Site assessment report are strictly limited in time and scope to the date of the evaluation(s). The conclusions presented in the Report are based solely on the services described therein, and not on scientific tasks or procedures beyond the scope of agreed upon services or the time and budgeting restraints imposed by the client.

The purpose of this report was to assess the physical characteristics of the subject Site with respect to the presence in the environment of hazardous material or oil. No specific attempt was made to check on the compliance of present or past owners or operators or of the Site with Federal, State or local laws and regulations, environmental, or otherwise.

Partial findings of this investigation are based on data provided by others. No warranty is expressed or implied with the usage of such data. Much of the information provided in this report is based upon personal interviews and research of all available documents, records and maps held by the appropriate government and private agencies. This is subject to the limitations of historical documentation, availability and accuracy of pertinent records, and the personal recollection of those persons contacted by *ECMS* personnel. *ECMS* is not a professional title insurance firm and makes no guarantee, explicit or implied that the listing, which was reviewed, represented a comprehensive delineation of past Site ownership or tenancy for legal purposes.

Observations were made of the Site and of structures on the Site as indicated within the Report. Where access to portions of the Site or to structures on the Site was unavailable or limited, *ECMS* is unable to render an opinion as to the presence of hazardous material or oil, or to the presence if indirect evidence relating to hazardous material or oil, in that portion of the Site or structure. In addition, *ECMS* renders no opinion as to the presence of hazardous material or oil, where direct observation of the interior walls, floor, or ceiling of a structure on a Site was obstructed by objects or coverings on or over these surfaces.

The initial site investigation took into account the natural and man-made features of the Site, including any unusual or suspect phenomenon. These factors combined with the Site's geology, hydrology, topography, and past and present land uses served as a basis for choosing a methodology and location for subsurface exploration as well as ground water and subsurface sampling, if done. The subsurface data, if provided, is meant as a representative overview of the Site.

The conclusions and recommendations contained in this report may be based in part upon various types of chemical data and are contingent upon their validity. As indicated within the Report, some

of these data are preliminary "screening" level data, and should be confirmed with quantitative analyses if more specific information is necessary. It should be noted that variations in the types and concentrations of contaminants and variations in their flow paths may occur due to seasonal water table fluctuations, past disposal practices, the passage of time, and other factors. Should additional data or variations of current data become available in the future, these data should be reviewed, and the conclusions and recommendations presented herein modified accordingly.

Chemical analyses may have been performed for specific parameters during the course of this Site assessment, as described in the text. However, it should be noted that additional chemical constituents not searched for during the current study might be present in soil and/or ground water at the Site.

Eurofins Environment Testing New England holds primary NELAC certification in the State of New York for the analytes as indicated with an X in the "Cert." column within this report. Please note that the State of New York does not offer certification for all analytes. Please refer to our website for specific certification holdings in each state.
Please note that this report contains 175 pages of analytical data plus Chain of Custody document(s). When the Laboratory Report is indicated as revised, this report supersedes any previously dated reports for the laboratory ID(s) referenced above. Where this report identifies subcontracted analyses, copies of the subcontractor's test report are available upon request. This report may not be reproduced, except in full, without written approval from Eurofins Environment Testing New England.

Eurofins Environment Testing New England is a NELAC accredited laboratory organization and meets NELAC testing standards. Use of the NELAC logo however does not insure that Eurofins Environment Testing New England is currently accredited for the specific method or analyte indicated. Please refer to our "Quality" web page at www.eurofinsus.com/Spectrum for a full listing of our current certifications and fields of accreditation.

Please contact the Laboratory or Technical Director at 413-789-9018 with any questions regarding the data contained in this laboratory report.

Sample Summary

Work Order: SC58794

Project: Cashman School - Amesbury, MA

Project Number: 1009.073

MassDEP Analytical Protocol Certification Form

Laboratory Name: Eurofins Spectrum Analytical, Inc. **Project #:** 1009.073

Project Location: Cashman School - Amesbury, MA **RTN:**

This form provides certifications for the following data set: SC58794-01 through SC58794-17

Matrices: Soil

CAM Protocol

✓ 8260 VOC CAM II A	✓ 7470/7471 Hg CAM III B	MassDEP VPH CAM IV A	✓ 8081 Pesticides CAM V B	7196 Hex Cr CAM VI B	MassDEP APH CAM IX A
✓ 8270 SVOC CAM II B	7010 Metals CAM III C	MassDEP EPH CAM IV B	✓ 8151 Herbicides CAM V C	8330 Explosives CAM VIII A	TO-15 VOC CAM IX B
✓ 6010 Metals CAM III A	6020 Metals CAM III D	✓ 8082 PCB CAM V A	9012 Total Cyanide/PAC CAM VI A	9014 Total Cyanide/PAC CAM VI A	6860 Perchlorate CAM VIII B

Affirmative responses to questions A through F are required for "Presumptive Certainty" status

A	Were all samples received in a condition consistent with those described on the Chain of Custody, properly preserved (including temperature) in the field or laboratory, and prepared/analyzed within method holding times?	Yes ✓ No
B	Were the analytical method(s) and all associated QC requirements specified in the selected CAM protocol(s) followed?	✓ Yes No
C	Were all required corrective actions and analytical response actions specified in the selected CAM protocol(s) implemented for all identified performance standard non-conformances?	✓ Yes No
D	Does the laboratory report comply with all the reporting requirements specified in CAM VII A, "Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data"?	✓ Yes No
E	a. VPH, EPH, and APH Methods only: Was each method conducted without significant modification(s)? b. APH and TO-15 Methods only: Was the complete analyte list reported for each method?	Yes No Yes No
F	Were all applicable CAM protocol QC and performance standard non-conformances identified and evaluated in a laboratory narrative (including all "No" responses to questions A through E)?	✓ Yes No

Responses to questions G, H and I below are required for "Presumptive Certainty" status

G	Were the reporting limits at or below all CAM reporting limits specified in the selected CAM protocol(s)?	✓ Yes No

***Data User Note:* Data that achieve "Presumptive Certainty" status may not necessarily meet the data usability and representativeness requirements described in 310 CMR 40. 1056 (2)(k) and WSC-07-350.**

H	Were all QC performance standards specified in the CAM protocol(s) achieved?	Yes ✓ No
I	Were results reported for the complete analyte list specified in the selected CAM protocol(s)?	✓ Yes No

All negative responses are addressed in a case narrative on the cover page of this report.

I, the undersigned, attest under the pains and penalties of perjury that, based upon my personal inquiry of those responsible for obtaining the information, the material contained in this analytical report is, to the best of my knowledge and belief, accurate and complete.

Dawn E. Wojcik

Dawn E. Wojcik
Laboratory Director
Date: 7/17/2020

CASE NARRATIVE:

Data has been reported to the RDL. This report excludes estimated concentrations detected below the RDL and above the MDL (J-Flag).

All non-detects and all results below the reporting limit are reported as "<" (less than) the reporting limit in this report.

The samples were received 2.3 degrees Celsius, please refer to the Chain of Custody for details specific to temperature upon receipt. An infrared thermometer with a tolerance of +/- 1.0 degrees Celsius was used immediately upon receipt of the samples.

If a Matrix Spike (MS), Matrix Spike Duplicate (MSD) or Duplicate (DUP) was not requested on the Chain of Custody, method criteria may have been fulfilled with a source sample not of this Sample Delivery Group. If method or program required MS/MSD/Dup were not performed, sufficient sample was not provided to the laboratory.

MADEP has published a list of analytical methods (CAM) which provides a series of recommended protocols for the acquisition, analysis and reporting of analytical data in support of MCP decisions. "Presumptive Certainty" can be established only for those methods published by the MADEP in the MCP CAM. The compounds and/or elements reported were specifically requested by the client on the Chain of Custody and in some cases may not include the full analyte list as defined in the method. Regulatory limits may not be achieved if specific method and/or technique was not requested on the Chain of Custody.

According to WSC-CAM 5/2009 Rev.1, Table 11 A-1, recovery for some VOC analytes have been deemed potentially difficult. Although they may still be within the recommended recovery range, a range has been set based on historical control limits.

Some target analytes which are not listed as exceptions in the Summary of CAM Reporting Limits may exceed the recommended RL based on sample initial volume or weight provided, % moisture content, or responsiveness of a particular analyte to purge and trap instrumentation.

All VOC soils samples submitted and analyzed in methanol will have a minimum dilution factor of 50. This is the minimum amount of solvent allowed on the instrumentation without causing interference. Soils are run on a manual load instrument. 100ug of sample (MEOH) is spiked into 5ml DI water along with the surrogate and added directly onto the instrument. Additional dilution factors may be required to keep analyte concentration within instrument calibration range.

Method SW846 5035A is designed to use on samples containing low levels of VOCs, ranging from 0.5 to 200 ug/Kg. Target analytes that are less responsive to purge and trap may be present at concentrations over 200ug/Kg but may not be reportable in the methanol preserved vial (SW846 5030). This is the result of the inherent dilution factor required for the methanol preservation.

Analyses for Total Hardness, pH, and Total Residual Chlorine fall under the state of Pennsylvania code Chapter 252.6 accreditation by rule.

Reactivity (40 CFR 261.23) Case Narrative:

These samples do not exhibit the characteristics of reactivity as defined in 40 CFR 261.23, sections (1), (2) and (4); however, Eurofins Spectrum Analytical, Inc. does not test for detonation, explosive reaction or potential, or forbidden explosives as defined in 40 CFR 261.23, sections (3), (6), (7) and (8).

Reactive sulfide and cyanide are tested at a pH of 2 and not tested at all conditions between pH 2 and12.5 as stated in 40 CFR 261.23, section (5); thus reactive cyanide and sulfide results as reported in this document can not be used to support the nonreactive properties of these samples.

The responsibility falls on the generator to use knowledge of the waste to determine if the waste meets or does not meet the descriptive, prose definition of reactivity.

See below for any non-conformances and issues relating to quality control samples and/or sample analysis/matrix.

SW8151A

Laboratory Control Samples:

537320A BSD

SW8151A

Laboratory Control Samples:

537320A BSD

Dinoseb RPD 64.3% (20%) is outside individual acceptance criteria.

CG33195-LCS

This parameter is outside laboratory rpd specified recovery limits.

Dinoseb

CG33195-LCSD

This parameter is outside laboratory rpd specified recovery limits.

Dinoseb

SW846 6010C

Laboratory Control Samples:

2001078 SRM/SRMD

Lead percent recoveries (82/86) are outside individual acceptance criteria, but within overall method allowances. All reported results of the following samples are considered to have a potentially low bias:

SS-1

Samples:

SC58794-05 *SSS-12*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-06 *SSS-13*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-07 *SSS-14*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SW846 8081B

Samples:

SC58794-08 *SSS-16*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-09 *SSS-17*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-10 *SSS-3*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-11 *SSS-4*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-12 *SSS-5*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-13 *SSS-6*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-14 *SSS-7*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-15 *SSS-8*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-16 *SSS-9*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

SC58794-17 *SSS-15*

The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.

Sample Acceptance Check Form

Client:	ECMS, Inc.
Project:	Cashman School - Amesbury, MA / 1009.073
Work Order:	SC58794
Sample(s) received on:	7/10/2020

The following outlines the condition of samples for the attached Chain of Custody upon receipt.

	Yes	No	N/A
Were custody seals present?	☐	☑	☐
Were custody seals intact?	☐	☐	☑
Were samples received at a temperature of ≤ 6°C?	☑	☐	☐
Were samples cooled on ice upon transfer to laboratory representative?	☑	☐	☐
Were sample containers received intact?	☑	☐	☐
Were samples properly labeled (labels affixed to sample containers and include sample ID, site location, and/or project number and the collection date)?	☑	☐	☐
Were samples accompanied by a Chain of Custody document?	☑	☐	☐
Does Chain of Custody document include proper, full, and complete documentation, which shall include sample ID, site location, and/or project number, date and time of collection, collector's name, preservation type, sample matrix and any special remarks concerning the sample?	☐	☑	☐
Did sample container labels agree with Chain of Custody document?	☑	☐	☐
Were samples received within method-specific holding times?	☑	☐	☐

Analyte(s)	Column	% Breakdown	Limit

Notes and Definitions

D	Data reported from a dilution
QC2	Analyte out of acceptance range in QC spike but no reportable concentration present in sample.
QC6	Analyte is out of acceptance range in the QC spike but the total number of out of range analytes is within overall method criteria.
QM7	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QM8	The spike recovery exceeded the QC control limits for the MS and/or MSD. The batch was accepted based upon acceptable PS and /or LCS recovery.
QM9	The spike recovery for this QC sample is outside the established control limits. The sample results for the QC batch were accepted based on LCS/LCSD or SRM recoveries within the control limits.
QR6	The RPD exceeded the QC control limits; however precision is demonstrated with acceptable RPD values for MS/MSD.
r	This parameter is outside laboratory rpd specified recovery limits.
Z-2	The closing calibration verification was below control limits, <20%, for the analyte 4,4-DDT, but greater than 50% recovery. This low recovery is due to sample matrix interference, which was confirmed by re-analysis.
dry	Sample results reported on a dry weight basis
NR	Not Reported
RPD	Relative Percent Difference
[2C]	Indicates concentration was reported from the secondary, confirmation column.
J	Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
pH	The method for pH does not stipulate a specific holding time other than to state that the samples should be analyzed as soon as possible. For aqueous samples the 40 CFR 136 specifies a holding time of 15 minutes from sampling to analysis. Therefore all aqueous pH samples not analyzed in the field are considered out of hold time at the time of sample receipt. All soil samples are analyzed as soon as possible after sample receipt.

Interpretation of Total Petroleum Hydrocarbon Report

Petroleum identification is determined by comparing the GC fingerprint obtained from the sample with a library of GC fingerprints obtained from analyses of various petroleum products. Possible match categories are as follows:

Gasoline - includes regular, unleaded, premium, etc.
Fuel Oil #2 - includes home heating oil, #2 fuel oil, and diesel
Fuel Oil #4 - includes #4 fuel oil
Fuel Oil #6 - includes #6 fuel oil and bunker "C" oil
Motor Oil - includes virgin and waste automobile oil
Ligroin - includes mineral spirits, petroleum naphtha, vm&p naphtha
Aviation Fuel - includes kerosene, Jet A and JP-4
Other Oil - includes lubricating and cutting oil, and silicon oil

At times, the unidentified petroleum product is quantified using a calibration that most closely approximates the distribution of compounds in the sample. When this occurs, the result is qualified as Calculated as.

Laboratory Control Sample (LCS): A known matrix spiked with compound(s) representative of the target analytes, which is used to document laboratory performance.

Matrix Duplicate: An intra-laboratory split sample which is used to document the precision of a method in a given sample matrix.

Matrix Spike: An aliquot of a sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

Method Blank: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting from the analytical process.

Method Detection Limit (MDL): The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte.

Reportable Detection Limit (RDL): The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. For many analytes the RDL analyte concentration is selected as the lowest non-zero standard in the calibration curve. While the RDL is approximately 5 to 10 times the MDL, the RDL for each sample takes into account the sample volume/weight, extract/digestate volume, cleanup procedures and, if applicable, dry weight correction. Sample RDLs are highly matrix-dependent.

Surrogate: An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. These compounds are spiked into all blanks, standards, and samples prior to analysis. Percent recoveries are calculated for each surrogate.

Continuing Calibration Verification: The calibration relationship established during the initial calibration must be verified at periodic intervals. Concentrations, intervals, and criteria are method specific.

CHAIN OF CUSTODY RECORD

Page 1 of 2

Special Handling:

☑ Standard TAT - 7 to 10 business days
☐ Rush TAT - Date Needed:
- All TATs subject to laboratory approval. Min. 24-hour notification needed for rushes.
- Samples disposed of after 60 days unless otherwise instructed.

CHAIN OF CUSTODY RECORD

Page 2 of 2

Special Handling:

☑ Standard TAT - 7 to 10 business days
☐ Rush TAT - Date Needed:
- All TATs subject to laboratory approval. Min. 24-hour notification needed for rushes.
- Samples disposed of after 60 days unless otherwise instructed.

Laboratory Report
SC59063

ECMS, Inc.
639 Granite Street, Suite 407
Braintree, MA 02184
Attn: Kevin Kavanaugh

Project: Cashman School - Amesbury, MA
Project #: 1009.073

I attest that the information contained within the report has been reviewed for accuracy and checked against the quality control requirements for each method. These results relate only to the sample(s) as received.
All applicable NELAC requirements have been met.

Massachusetts # RI907
New York # 11393
Rhode Island # LAI00368
USDA # P330-20-00109

Authorized by:

Agnes Huntley
Project Manager

Eurofins Environment Testing New England holds primary certification in the State of Massachusetts for the analytes as indicated with an X in the "Cert." column within this report. Please note that the State of Massachusetts does not offer certification for all analytes. Please refer to our website for specific certification holdings in each state.
Please note that this report contains 17 pages of analytical data plus Chain of Custody document(s). When the Laboratory Report is indicated as revised, this report supersedes any previously dated reports for the laboratory ID(s) referenced above. Where this report identifies subcontracted analyses, copies of the subcontractor's test report are available upon request. This report may not be reproduced, except in full, without written approval from Eurofins Environment Testing New England.

Eurofins Environment Testing New England is a NELAC accredited laboratory organization and meets NELAC testing standards. Use of the NELAC logo however does not insure that Eurofins Environment Testing New England is currently accredited for the specific method or analyte indicated. Please refer to our "Quality" web page at www.eurofinsus.com/Spectrum for a full listing of our current certifications and fields of accreditation.

Please contact the Laboratory or Technical Director at 413-789-9018 with any questions regarding the data contained in this laboratory report.

Sample Summary

Work Order: SC59063

Project: Cashman School - Amesbury, MA

Project Number: 1009.073

MassDEP Analytical Protocol Certification Form

Laboratory Name: Eurofins Spectrum Analytical, Inc.	**Project #:** 1009.073
Project Location: Cashman School - Amesbury, MA	**RTN:**
This form provides certifications for the following data set:	SC59063-01 through SC59063-08
Matrices: Soil	

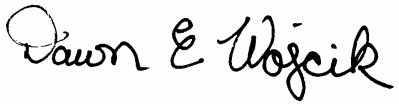
CAM Protocol

8260 VOC CAM II A	✓ 7470/7471 Hg CAM III B	MassDEP VPH CAM IV A	8081 Pesticides CAM V B	7196 Hex Cr CAM VI B	MassDEP APH CAM IX A
8270 SVOC CAM II B	7010 Metals CAM III C	MassDEP EPH CAM IV B	8151 Herbicides CAM V C	8330 Explosives CAM VIII A	TO-15 VOC CAM IX B
✓ 6010 Metals CAM III A	6020 Metals CAM III D	8082 PCB CAM V A	9012 Total Cyanide/PAC CAM VI A	9014 Total Cyanide/PAC CAM VI A	6860 Perchlorate CAM VIII B

Affirmative responses to questions A through F are required for "Presumptive Certainty" status

A	Were all samples received in a condition consistent with those described on the Chain of Custody, properly preserved (including temperature) in the field or laboratory, and prepared/analyzed within method holding times?	✓ Yes No
B	Were the analytical method(s) and all associated QC requirements specified in the selected CAM protocol(s) followed?	✓ Yes No
C	Were all required corrective actions and analytical response actions specified in the selected CAM protocol(s) implemented for all identified performance standard non-conformances?	✓ Yes No
D	Does the laboratory report comply with all the reporting requirements specified in CAM VII A, "Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data"?	✓ Yes No
E	a. VPH, EPH, and APH Methods only: Was each method conducted without significant modification(s)? b. APH and TO-15 Methods only: Was the complete analyte list reported for each method?	Yes No Yes No
F	Were all applicable CAM protocol QC and performance standard non-conformances identified and evaluated in a laboratory narrative (including all "No" responses to questions A through E)?	✓ Yes No

Responses to questions G, H and I below are required for "Presumptive Certainty" status



G	Were the reporting limits at or below all CAM reporting limits specified in the selected CAM protocol(s)?	Yes ✓ No

<u>Data User Note:</u> Data that achieve "Presumptive Certainty" status may not necessarily meet the data usability and representativeness requirements described in 310 CMR 40. 1056 (2)(k) and WSC-07-350.

H	Were all QC performance standards specified in the CAM protocol(s) achieved?	Yes ✓ No
I	Were results reported for the complete analyte list specified in the selected CAM protocol(s)?	✓ Yes No

All negative responses are addressed in a case narrative on the cover page of this report.

I, the undersigned, attest under the pains and penalties of perjury that, based upon my personal inquiry of those responsible for obtaining the information, the material contained in this analytical report is, to the best of my knowledge and belief, accurate and complete.

Dawn E. Wojcik
Laboratory Director
Date: 8/20/2020

CASE NARRATIVE:

Data has been reported to the RDL. This report excludes estimated concentrations detected below the RDL and above the MDL (J-Flag).

All non-detects and all results below the reporting limit are reported as "<" (less than) the reporting limit in this report.

The samples were received 2.4 degrees Celsius, please refer to the Chain of Custody for details specific to temperature upon receipt. An infrared thermometer with a tolerance of +/- 1.0 degrees Celsius was used immediately upon receipt of the samples.

If a Matrix Spike (MS), Matrix Spike Duplicate (MSD) or Duplicate (DUP) was not requested on the Chain of Custody, method criteria may have been fulfilled with a source sample not of this Sample Delivery Group. If method or program required MS/MSD/Dup were not performed, sufficient sample was not provided to the laboratory.

MADEP has published a list of analytical methods (CAM) which provides a series of recommended protocols for the acquisition, analysis and reporting of analytical data in support of MCP decisions. "Presumptive Certainty" can be established only for those methods published by the MADEP in the MCP CAM. The compounds and/or elements reported were specifically requested by the client on the Chain of Custody and in some cases may not include the full analyte list as defined in the method. Regulatory limits may not be achieved if specific method and/or technique was not requested on the Chain of Custody.

According to WSC-CAM 5/2009 Rev.1, Table 11 A-1, recovery for some VOC analytes have been deemed potentially difficult. Although they may still be within the recommended recovery range, a range has been set based on historical control limits.

Some target analytes which are not listed as exceptions in the Summary of CAM Reporting Limits may exceed the recommended RL based on sample initial volume or weight provided, % moisture content, or responsiveness of a particular analyte to purge and trap instrumentation.

See below for any non-conformances and issues relating to quality control samples and/or sample analysis/matrix.

SW846 6010C

Laboratory Control Samples:

2001427 SRM/SRMD

Lead percent recoveries (176/81) are outside individual acceptance criteria, but within overall method allowances. All reported results of the following samples are considered to have a potentially high bias:

SSS-26
SSS-27
SSS-28
SSS-29
SSS-30
SSS-31
SSS-32
SSS-33

Silver percent recoveries (82/72) are outside individual acceptance criteria, but within overall method allowances. All reported results of the following samples are considered to have a potentially low bias:

SSS-26
SSS-27
SSS-28
SSS-29
SSS-30
SSS-31
SSS-32
SSS-33

Spikes:

Spikes:

2001428-MSD1 *Source: SC59063-03*

The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.

Mercury

Sample Acceptance Check Form

Client:	ECMS, Inc.
Project:	Cashman School - Amesbury, MA / 1009.073
Work Order:	SC59063
Sample(s) received on:	8/13/2020

The following outlines the condition of samples for the attached Chain of Custody upon receipt.

	Yes	No	N/A
Were custody seals present?	☐	☑	☐
Were custody seals intact?	☐	☐	☑
Were samples received at a temperature of ≤ 6°C?	☑	☐	☐
Were samples refrigerated upon transfer to laboratory representative?	☑	☐	☐
Were sample containers received intact?	☑	☐	☐
Were samples properly labeled (labels affixed to sample containers and include sample ID, site location, and/or project number and the collection date)?	☑	☐	☐
Were samples accompanied by a Chain of Custody document?	☑	☐	☐
Does Chain of Custody document include proper, full, and complete documentation, which shall include sample ID, site location, and/or project number, date and time of collection, collector's name, preservation type, sample matrix and any special remarks concerning the sample?	☑	☐	☐
Did sample container labels agree with Chain of Custody document?	☑	☐	☐
Were samples received within method-specific holding times?	☑	☐	☐

Notes and Definitions

D	Data reported from a dilution
QM7	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QM8	The spike recovery exceeded the QC control limits for the MS and/or MSD. The batch was accepted based upon acceptable PS and /or LCS recovery.
QM9	The spike recovery for this QC sample is outside the established control limits. The sample results for the QC batch were accepted based on LCS/LCSD or SRM recoveries within the control limits.
R06	MRL raised to correlate to batch QC reporting limits.
dry	Sample results reported on a dry weight basis
NR	Not Reported
RPD	Relative Percent Difference
J	Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).

Laboratory Control Sample (LCS): A known matrix spiked with compound(s) representative of the target analytes, which is used to document laboratory performance.

Matrix Duplicate: An intra-laboratory split sample which is used to document the precision of a method in a given sample matrix.

Matrix Spike: An aliquot of a sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

Method Blank: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting from the analytical process.

Method Detection Limit (MDL): The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte.

Reportable Detection Limit (RDL): The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. For many analytes the RDL analyte concentration is selected as the lowest non-zero standard in the calibration curve. While the RDL is approximately 5 to 10 times the MDL, the RDL for each sample takes into account the sample volume/weight, extract/digestate volume, cleanup procedures and, if applicable, dry weight correction. Sample RDLs are highly matrix-dependent.

Surrogate: An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. These compounds are spiked into all blanks, standards, and samples prior to analysis. Percent recoveries are calculated for each surrogate.

Continuing Calibration Verification: The calibration relationship established during the initial calibration must be verified at periodic intervals. Concentrations, intervals, and criteria are method specific.

Special Handling:

☑ Standard TAT - 7 to 10 business days
☐ Rush TAT - Date Needed:

- All TATs subject to laboratory approval. Min. 24-hour notification needed for rushes.
- Samples disposed of after 60 days unless otherwise instructed.

MADEP MCP Response Action Analytical Report Certification

This form provides certifications for all samples performed by MCP methods. Please refer to the Sample Results and Container Information sections of this report for specification of MCP methods used for each analysis. The following questions pertain only to MCP Analytical Methods.

An affirmative response to questions A through F is required for "Presumptive Certainty" status		
A	Were all samples received in a condition consistent with those described on the Chain-of-Custody, properly preserved (including temperature) in the field or laboratory, and prepared/analyzed within method holding times?	NO
B	Were the analytical method(s) and all associated QC requirements specified in the selected CAM protocol(s) followed?	YES
C	Were all required corrective actions and analytical response actions specified in the selected CAM protocol(s) implemented for all identified performance standard non-conformances?	YES
D	Does the laboratory report comply with all the reporting requirements specified in CAM VII A, "Quality Assurance and Quality Control Guidelines for the Acquisition and Reporting of Analytical Data?"	YES
E a.	VPH, EPH, and APH Methods only: Was each method conducted without significant modification(s)? (Refer to the individual method(s) for a list of significant modifications).	N/A
E b.	APH and TO-15 Methods only: Was the complete analyte list reported for each method?	N/A
F	Were all applicable CAM protocol QC and performance standard non-conformances identified and evaluated in a laboratory narrative (including all "No" responses to Questions A through E)?	YES

A response to questions G, H and I is required for "Presumptive Certainty" status		
G	Were the reporting limits at or below all CAM reporting limits specified in the selected CAM protocol(s)?	YES
H	Were all QC performance standards specified in the CAM protocol(s) achieved?	NO
I	Were results reported for the complete analyte list specified in the selected CAM protocol(s)?	NO

For any questions answered "No", please refer to the case narrative section on the following page(s).

Please note that sample matrix information is located in the Sample Results section of this report.

Project Name:	RTN 3-0036397	**Lab Number:**	L2033028
Project Number:	102006.00	**Report Date:**	08/20/20

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Project Number:	102006.00	**Report Date:**	08/20/20

Case Narrative (continued)

MCP Related Narratives

Sample Receipt

The Metals analyses performed were specified by the client.

In reference to question A:

The samples were received at the laboratory above the required temperature range and were not on ice.

In reference to question H:

A Matrix Spike was not submitted for the analysis of Total Metals.

Total Metals

In reference to question I:

All samples were analyzed for a subset of MCP analytes per client request.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

DL - Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

EDL - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).

EMPC - Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.

EPA - Environmental Protection Agency.

LCS - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LCSD - Laboratory Control Sample Duplicate: Refer to LCS.

LFB - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.

LOD - Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

LOQ - Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)

MDL - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

MS - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.

MSD - Matrix Spike Sample Duplicate: Refer to MS.

NA - Not Applicable.

NC - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.

NDPA/DPA - N-Nitrosodiphenylamine/Diphenylamine.

NI - Not Ignitable.

NP - Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.

RL - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.

RPD - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

SRM - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

STLP - Semi-dynamic Tank Leaching Procedure per EPA Method 1315.

TEF - Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.

TEQ - Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.

TIC - Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: Data Usability Report

Project Name:	RTN 3-0036397	**Lab Number:**	L2033028
Project Number:	102006.00	**Report Date:**	08/20/20

1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Difference: With respect to Total Oxidizable Precursor (TOP) Assay analysis, the difference is defined as the Post-Treatment value minus the Pre-Treatment value.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PAH Total: With respect to Alkylated PAH analyses, the 'PAHs, Total' result is defined as the summation of results for all or a subset of the following compounds: Naphthalene, C1-C4 Naphthalenes, 2-Methylnaphthalene, 1-Methylnaphthalene, Biphenyl, Acenaphthylene, Acenaphthene, Fluorene, C1-C3 Fluorenes, Phenanthrene, C1-C4 Phenanthrenes/Anthracenes, Anthracene, Fluoranthene, Pyrene, C1-C4 Fluoranthenes/Pyrenes, Benz(a)anthracene, Chrysene, C1-C4 Chrysenes, Benzo(b)fluoranthene, Benzo(j)+(k)fluoranthene, Benzo(e)pyrene, Benzo(a)pyrene, Perylene, Indeno(1,2,3-cd)pyrene, Dibenz(ah)+(ac)anthracene, Benzo(g,h,i)perylene. If a 'Total' result is requested, the results of its individual components will also be reported.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

The target compound Chlordane (CAS No. 57-74-9) is reported for GC ECD analyses. Per EPA,this compound "refers to a mixture of chlordane isomers, other chlorinated hydrocarbons and numerous other components." (Reference: USEPA Toxicological Review of Chlordane, In Support of Summary Information on the Integrated Risk Information System (IRIS), December 1997.)

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A - Spectra identified as "Aldol Condensates" are byproducts of the extraction/concentration procedures when acetone is introduced in the process.

B - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

F - The ratio of quantifier ion response to qualifier ion response falls outside of the laboratory criteria. Results are considered to be an estimated maximum concentration.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

J - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND - Not detected at the reporting limit (RL) for the sample.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration

Report Format: Data Usability Report

Project Name:	RTN 3-0036397	**Lab Number:**	L2033028
Project Number:	102006.00	**Report Date:**	08/20/20

Data Qualifiers

Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

Acknowledgments

This investigation would not have been possible without the participation of the many well users who sent in water samples for analysis. Discussion and project planning with the late Elaine Krueger was instrumental for development of the project. Support from the Massachusetts Department of Environmental Protection and the Massachusetts Department of Public Health is greatly appreciated.

Arsenic and Uranium in Water from Private Wells Completed in Bedrock of East-Central Massachusetts—Concentrations, Correlations with Bedrock Units, and Estimated Probability Maps

By John A. Colman

Abstract

Two U.S. Environmental Protection Agency drinking-water standards for public supplies involving groundwater contaminants that may derive from bedrock sources were promulgated between 2003 and 2006. A new arsenic drinking-water standard, a maximum contaminant level (MCL) of 10 micrograms per liter, became effective in January 2006. The non-radon radionuclides final standard took effect in December 2003, with an MCL for uranium of 30 micrograms per liter. This investigation, conducted in cooperation with the Massachusetts Department of Environmental Protection and the Massachusetts Department of Public Health, assessed the concentration ranges of arsenic and uranium in bedrock wells with reference to the new concentration standards, and associations of arsenic and uranium with bedrock units of the wells of east-central Massachusetts. The investigation focused on east-central Massachusetts, because State public bedrock-well databases indicate that arsenic concentrations in bedrock well water are elevated in that area. The project exploited the wide areal coverage of private wells to give the first detailed look at concentration distributions of arsenic and uranium through the high-arsenic zone of Massachusetts. The results establish statistical probabilities for elevated concentrations by bedrock unit at the scale of the State geologic map (1:250,000), which can guide future well-water testing, treatment, and supply development.

Well sampling was from 478 randomly selected wells by private-well users who were sent sampling-kit bottles with instructions and a water-use questionnaire. Results indicated that 13 percent of the randomly selected wells contained water with concentrations greater than the drinking-water standard established for public wells for arsenic, and 3.5 percent were greater than the standard for uranium. Arsenic and uranium did not in general co-occur in water of a given well. Of the wells with concentrations exceeding the standards, the questionnaire results indicated that 66 percent were being used for drinking water without treatment for arsenic, and 93 percent were being used without treatment for uranium.

Statistical analysis of the results indicated that distributions of arsenic and uranium concentrations grouped by bedrock unit were log normal. Statistically significant differences were found among distributions by bedrock unit for both arsenic and uranium. However, a zone of elevated concentrations of arsenic was found in groundwater west of the Clinton-Newbury fault (a boundary between two geologic terranes), where correlation between arsenic concentrations and the bedrock units was not significant.

Increased sampling in the investigation was directed in the regions of three 1:24,000 (7.5-minute) quadrangles where recent detailed geologic mapping had been conducted. Improved correlations of arsenic and uranium with bedrock unit were measured for two of the three quadrangles compared to the correlations made for the statewide map.

Cumulative distribution frequencies of concentrations grouped by rock unit or area (zone of elevated arsenic concentration) were used to assess the probability of wells having concentrations exceeding the drinking-water standards. The probabilities were mapped and applied to the estimated number of private wells in the study area to determine the likely number of wells in the study area with concentrations exceeding the standards. For arsenic and uranium, respectively, about 5,700 and 3,300 wells were estimated to contain concentrations exceeding the standards. Estimates for arsenic may approach the total number for the State, because the study area covered the principal known area of elevated arsenic concentrations.

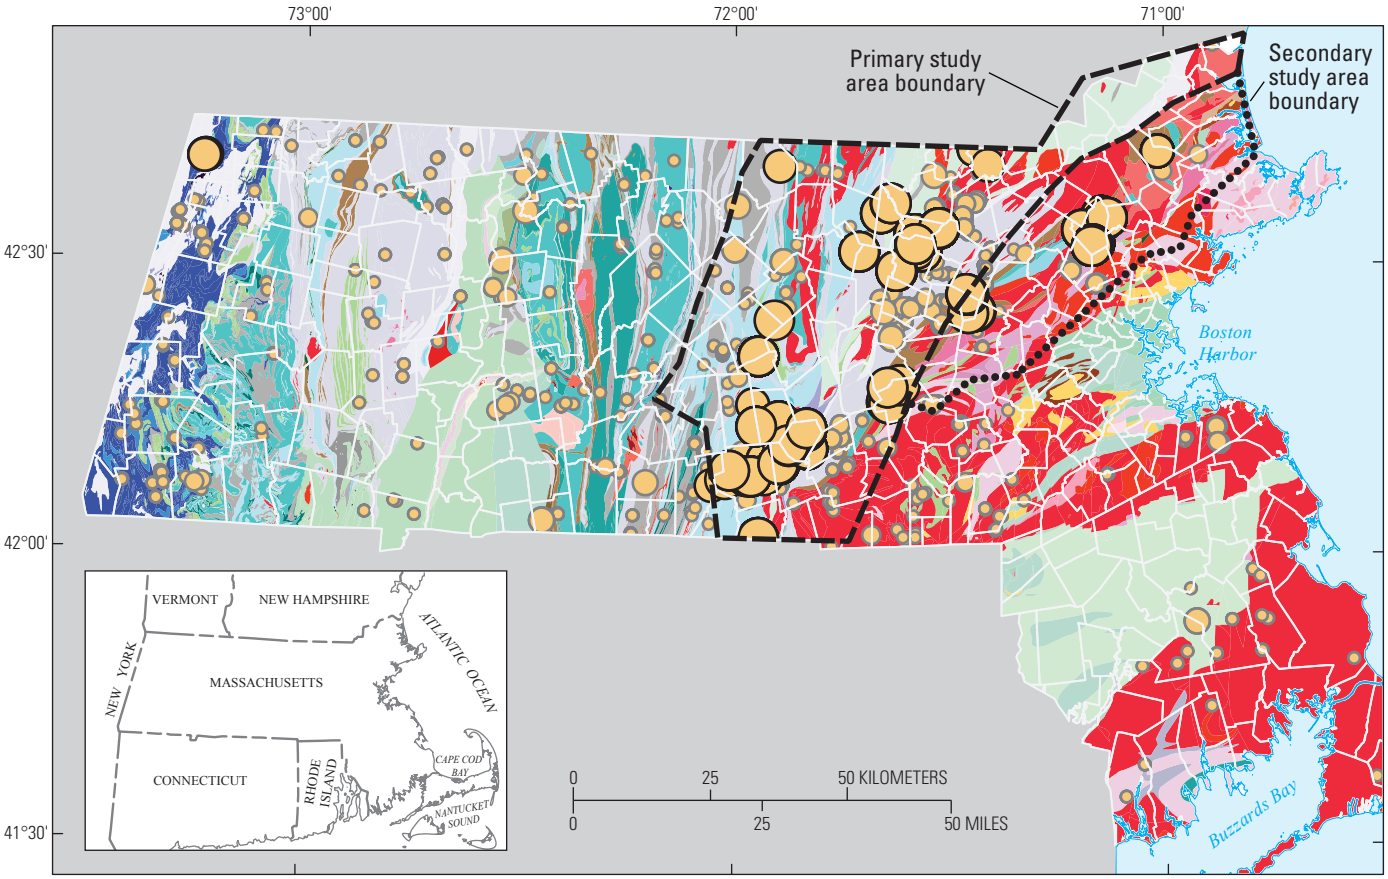
Introduction

Two U.S. Environmental Protection Agency (USEPA) drinking-water standards involving groundwater contaminants that may derive from bedrock sources were promulgated between 2003 and 2006. A new maximum contaminant level (MCL) standard of 10 micrograms per liter (µg/L) for arsenic in drinking water became effective in February 2002, with compliance required by January 2006. The non-radon radionuclides final rule took effect in December 2003, with an MCL for uranium of 30 µg/L. The standards apply to public water supplies. In Massachusetts, the Massachusetts Department of Environmental Protection (MDEP) recommends that the standards also be used as guidelines for private supplies (Massachusetts Department of Environmental Protection, 2008).

Private water supply in Massachusetts, exclusive of the sand and gravel aquifers of the southeastern part of the State, is obtained primarily from wells drilled in bedrock (Hansen and Simcox, 1994). Bedrock water sources also are used for small commercial water supplies and, in some locations, for moderate to large municipal and industrial supplies (Hansen and Simcox, 1994; Lyford, and others 2003). Tens of thousands of private and public bedrock wells are used in the State —91,000 private bedrock wells were estimated for the bedrock geologic units investigated in this study.

Arsenic has long been known to be present in water from bedrock wells in east-central Massachusetts (Zuena and Keane, 1985; Ayotte and others, 2003; 2006), and the State straddles an arsenic belt that extends from Connecticut to New Brunswick, Canada. Elevated uranium concentrations in water from bedrock wells have been associated with igneous rock throughout New England, but also are present in water from other crystalline rock aquifers in the region (Ayotte and others, 2007). This investigation, conducted by the U.S. Geological Survey (USGS) in cooperation with the Massachusetts Department of Environmental Protection (MDEP) and the Massachusetts Department of Public Health (MDPH), was designed to assess the concentration ranges and associations of arsenic and uranium with reference to the new concentration standards and to the classifications of the bedrock geologic units (hereafter bedrock units) in which the wells are drilled. The results can be used to establish statistical probabilities for elevated concentrations by bedrock unit, which can guide future well-water testing, treatment, and supply development.

Purpose and Scope



Information about bedrock associations of arsenic and uranium with bedrock well water are needed in Massachusetts to guide future well-water testing, treatment, and supply development. Probability distributions of well-water contaminants by bedrock unit will indicate the likelihood of contamination at a given concentration. Maps of these probabilities can be used to determine the likelihood of the presence of elevated arsenic or uranium concentrations in water of new wells in a given location or for directing testing priorities for existing wells.

The study encompasses the east-central arsenic belt in Massachusetts (fig. 1), the location of nearly all contamination of bedrock wells in the State by arsenic from a natural source. Many but not all wells contaminated by uranium are included in the same area, although igneous rocks, and likely uranium contamination, also occur outside the arsenic belt.

The principal focus of this report is the collection and interpretation of new data from 478 private bedrock wells. The amount of existing unpublished MDEP data from public bedrock wells is large, however, and may substantially supplement the number of observations per bedrock unit. The public bedrock-well data were used for qualitative analysis of the extent of contamination of bedrock units. The newly collected data were used to compute statistics of contaminant distribution. A reporting goal is to produce maps showing the probability statistic that concentrations of arsenic or uranium in well water exceed the drinking-water standards.

Health Effects of Arsenic and Uranium

Health effects from exposure to elevated concentrations of arsenic in drinking water have been established from studies in countries with very elevated levels of arsenic in water supplies, especially Taiwan (Smith and others, 1992; Lamm and others, 2003). Inorganic arsenic is well documented as a human carcinogen of the bladder, lungs, and skin (Centeno and others, 2007). Inorganic arsenic has also been demonstrated to affect many other organ systems, including the gastrointestinal, hepatic, cardiovascular, nervous, renal, and hematopoietic systems. A recent interest in arsenic in drinking water in the northeastern part of the United States relates to possible correlations with increased rates of bladder cancer in the region (Devasa and others, 1999; Ayotte and others, 2006). Epidemiological results demonstrating links between arsenic and health problems involve concentrations greater than the current USEPA drinking-water standard by an order of magnitude or more (National Research Council, 2001). Risk levels at

the standard are determined by extrapolation from the higher exposure studies. The National Research Council review for the National Academy of Science estimated the bladder cancer risk at about 12 to 23 per 10,000 persons with lifetime consumption of drinking water at 10 µg/L, the current public supply drinking-water standard. Lung cancer risk is estimated at about 14 to 19 per 10,000 persons at 10 µg/L (National Research Council, 2001).

Little is known about the long-term health effects on humans of exposure to low-level environmental uranium. Studies of occupationally exposed persons, such as uranium miners, have shown that the major health effect of uranium in the body is renal (kidney) toxicity (Leggett, 1989; Taylor and Taylor, 1997).

A discussion of the health effects of uranium in New England can also consider the effects of radium and radon, which are associated with uranium in crystalline bedrock aquifers (Ayotte and others, 2007). The association arises from the radioactive decay chain of uranium, which results in radium, through several radioactive decay product precursors. Radium decays directly to short-half-lived radon (3.8 days). Decay of radon results in four short-lived daughters and then longer-lived lead (22 years). Where uranium in drinking water is measured greater than the standard, analyses for radium and radon also could be done. Depending on the analysis technique, differential costs of analyses of the radionuclides means that uranium analysis may be an inexpensive indicator (when compared to gross alpha analysis) for determining the presence or absence of other radionuclides.

Previous Investigations

Several previous water-quality investigations exist for arsenic in New England and areas of Massachusetts. Investigations of uranium are more limited and cover the entire Northeast. The first published investigation to address the concerns of arsenic concentrations in private bedrock wells of New England referred to southeastern New Hampshire (Boudette and others, 1985). Bedrock and anthropogenic sources were analyzed, and the conclusion was drawn that the source was probably anthropogenic. A similar investigation of arsenic wells in Buxton, Maine, concluded that the likely source was bedrock (Marvinney and others, 1994). A three-town investigation in southern New Hampshire, very similar to the present Massachusetts investigation, reported the percentages of arsenic samples with concentrations greater than the 10 µg/L standard by bedrock unit (Montgomery and others, 2003). Several New England-based investigations have evaluated the risk for arsenic occurrence in the region—number of wells affected and probability maps of concentrations greater than or equal to 5 µg/L (for example, Karagas and others, 2002; Ayotte and others, 2003; 2006). Ayotte (2006) used a logistic regression based on many geologic, hydrologic, and anthropologic statistics for the region. A nationwide investigation of contaminants in private wells of selected aquifers included distribution plots of arsenic concentrations for the New England bedrock aquifer (DeSimone, 2009). The New England aquifer was the only aquifer investigated in the eastern United States with elevated concentrations of arsenic in private wells.

One survey of arsenic in private wells from Massachusetts is available from an investigation in Pepperell, Massachusetts (SEA Consultants, 1985). Water was analyzed from 300 wells, and 12 percent of them had concentrations that exceeded the 50-µg/L USEPA standard that was in effect at that time. Attempts to distinguish natural sources of arsenic in bedrock from anthropogenic sources, such as pesticides applied to orchards, were not successful.

Finally, a geologically based review of arsenic presence in the Northeast was published by Peters (2008). The investigation discusses arsenic presence in overburden and bedrock wells from natural and anthropogenic sources. Peters (2008) showed that arsenic concentrations were not correlated with iron concentrations in bedrock well water, and that elevated arsenic concentrations were associated with contacts between metamorphic and intrusive igneous rock.

Uranium was included in the DeSimone (2009) survey of private wells, including several overstandard samples in the New England crystalline-rock aquifers, but the study involved few samples from Massachusetts. In an investigation summarizing uranium and radon data from the northern United States, a correlation was found between uranium, radium, and radon in the New England bedrock aquifer (Ayotte and others 2007). Of the nine northern aquifers investigated, median concentrations of radon and uranium were highest and third highest, respectively, in the New England bedrock aquifer.

Investigative Design

The investigative design followed that of Montgomery and others (2003) in southeastern New Hampshire, addressing the correlations between bedrock units and concentrations of arsenic and uranium. The intent in this study was to cover the known elevated-arsenic areas in Massachusetts so that the assessment of arsenic contamination in the State would be advanced as much as possible. However, future studies may be necessary to characterize other parts of the State with limited areas of elevated arsenic.

Study Area

The primary study area (fig. 1), in east-central Massachusetts, was chosen to include the area of elevated results (greater than or equal to the USEPA drinking-water standard for public supplies, 10 µg/L) of arsenic in public wells (primarily bedrock) published from the MDEP database (Ayotte and others, 2003). Data reviewed after initiation of the project (J.A. Cerutti, Massachusetts Department of Environmental Protection, written commun., 2008; Ayotte,

2006) indicated additional elevated concentrations to the east of the principal study area and one elevated value in the northwest (fig. 1). The primary study area was augmented with a secondary study area (fig. 1) to cover the elevated concentrations in the east. By including the areas of known elevated concentration, the investigation would define arsenic occurrence in the principal areas of Massachusetts where concentrations could be expected to exceed the drinking-water standard.

Although the project study areas were determined on the basis of concentrations of arsenic in bedrock wells, the areas were also appropriate for investigation of uranium (fig. 2). MDEP data show that the arsenic-defined areas include many of the elevated concentrations of uranium in the State. The MDEP uranium coverage is less extensive than that for arsenic, so uranium concentrations are unknown in some areas. Not all of the bedrock units that may have elevated uranium were characterized in the present investigation; however, enough elevated-concentration units were included that correlations between uranium and bedrock unit would be apparent if uranium were controlled by rock type.

The distribution of bedrock units of crystalline igneous and metamorphic rocks in the study area is complex (fig. 3). The study area is crossed by major faults that divide parts of three geologic terranes that include the Merrimack belt, the Nashoba zone and the Milford-Dedham zone (Hatch, 1991, p. v, fig. 2). The primary study area includes most of the Merrimack belt, which extends from the Connecticut Valley belt (indicated by the Merrimack belt western boundary in fig. 3) to the Clinton-Newbury fault (fig. 3), and the western half of the Nashoba zone, which extends from the Clinton-Newbury fault to the Bloody Bluff fault (fig. 3). The secondary study area includes the remainder of the Nashoba zone and the western edge of the Milford-Dedham zone, which begins at the Bloody Bluff fault and extends to the east.

Geologic units are as defined in the digitized version (Nicholson and others, 2007) of the bedrock map of Massachusetts (Zen and others, 1983). The use of these maps to define geologic units for wells is, of course, only as accurate as could be determined from a 1:250,000-scale map. There is the chance that wells near a bedrock boundary may not be correctly assigned to a bedrock unit. Bedrock wells are on the order of 100 m deep and unscreened in their bedrock portions. As such, they may encounter geologic units at depth that are different from units as mapped at the surface. But, due to the scale of the map (1:250,000), only the major rock type is shown at the location of the borehole. For example, a borehole study in a 305-m deep well in Tyngsborough, Mass., is located in the Ayer Granite bedrock unit SOad, but the borehole contains xenoliths of the host metasedimentary Berwick Formation (unit Sb) (Pierce and others, 2007). The level of detail seen in boreholes cannot be displayed on a State-scale map, and detailed studies of individual boreholes are beyond the scope of this regional study.

Sampling Distribution

Well locations were chosen for the study areas by stratified random selection across the bedrock units. Previous arsenic-concentration data (Ayotte and others, 2003; Joseph Cerutti, unpub. data, 2008) indicated that arsenic was more prevalent in the 69 bedrock units of the primary study area, so more sampling was directed at this area. One sampling objective was to collect at least seven samples per bedrock unit so that statistical inference could be made even for small units. So that large units would have coverage throughout their extent, a second objective was applied to supplement the initial seven samples by an additional one sample per 20 km^2 for units 20 km^2 and larger. The largest unit, the Paxton Formation (Sp), is 822 km^2, so the sampling objective for this unit was 48 wells. In the secondary area, the selection objective was 5 wells for each of the 12 bedrock units investigated.

Although a minimum of seven sites per unit in the primary study area was desired, some small units did not have this number of private wells (or even residences) available. Also, areas with public water supplies were necessarily excluded from the investigation, which left gaps in data for some units. These unavoidable exclusions of sampled areas biased the study toward areas where bedrock wells existed.

Wells were selected using randomly generated geo-coordinates and matching closest Google-Earth determined locations of well addresses to well lists provided by the Massachusetts Department of Conservation and Recreation. Locations of the selected sites were moved from the street locations provided by Google Earth to positions of the building at that address using field observations of addresses and buildings, and georeferenced ORTHO photos (Massachusetts Office of Geographic Information (MassGIS), 2005).

Increased sampling in the investigation was directed in the regions of three 1:24,000 (7.5 minute) quadrangles where recent detailed geologic mapping had been conducted. Comparisons of correlations of arsenic and uranium with geologic units based on 1:250,000-scale mapping to those based on more recent 1:24,000-scale mapping could indicate the efficacy of remapping for arsenic and uranium delineation and for correlation with bedrock.

Sample Collection and the Well-User Questionnaire

Samples were collected by private well users during spring and summer of 2009, using bottles included in a sampling kit mailed to the residence at the location of the well. The kit included two labeled 125-mL bottles, a business reply Tyvek® envelope, and a questionnaire to determine water-use practices at the site, as well as to inform the bottle recipients about the program and how to collect the water sample (app. 2). Twice as many sampling kits were mailed out compared to the number required to meet the sampling

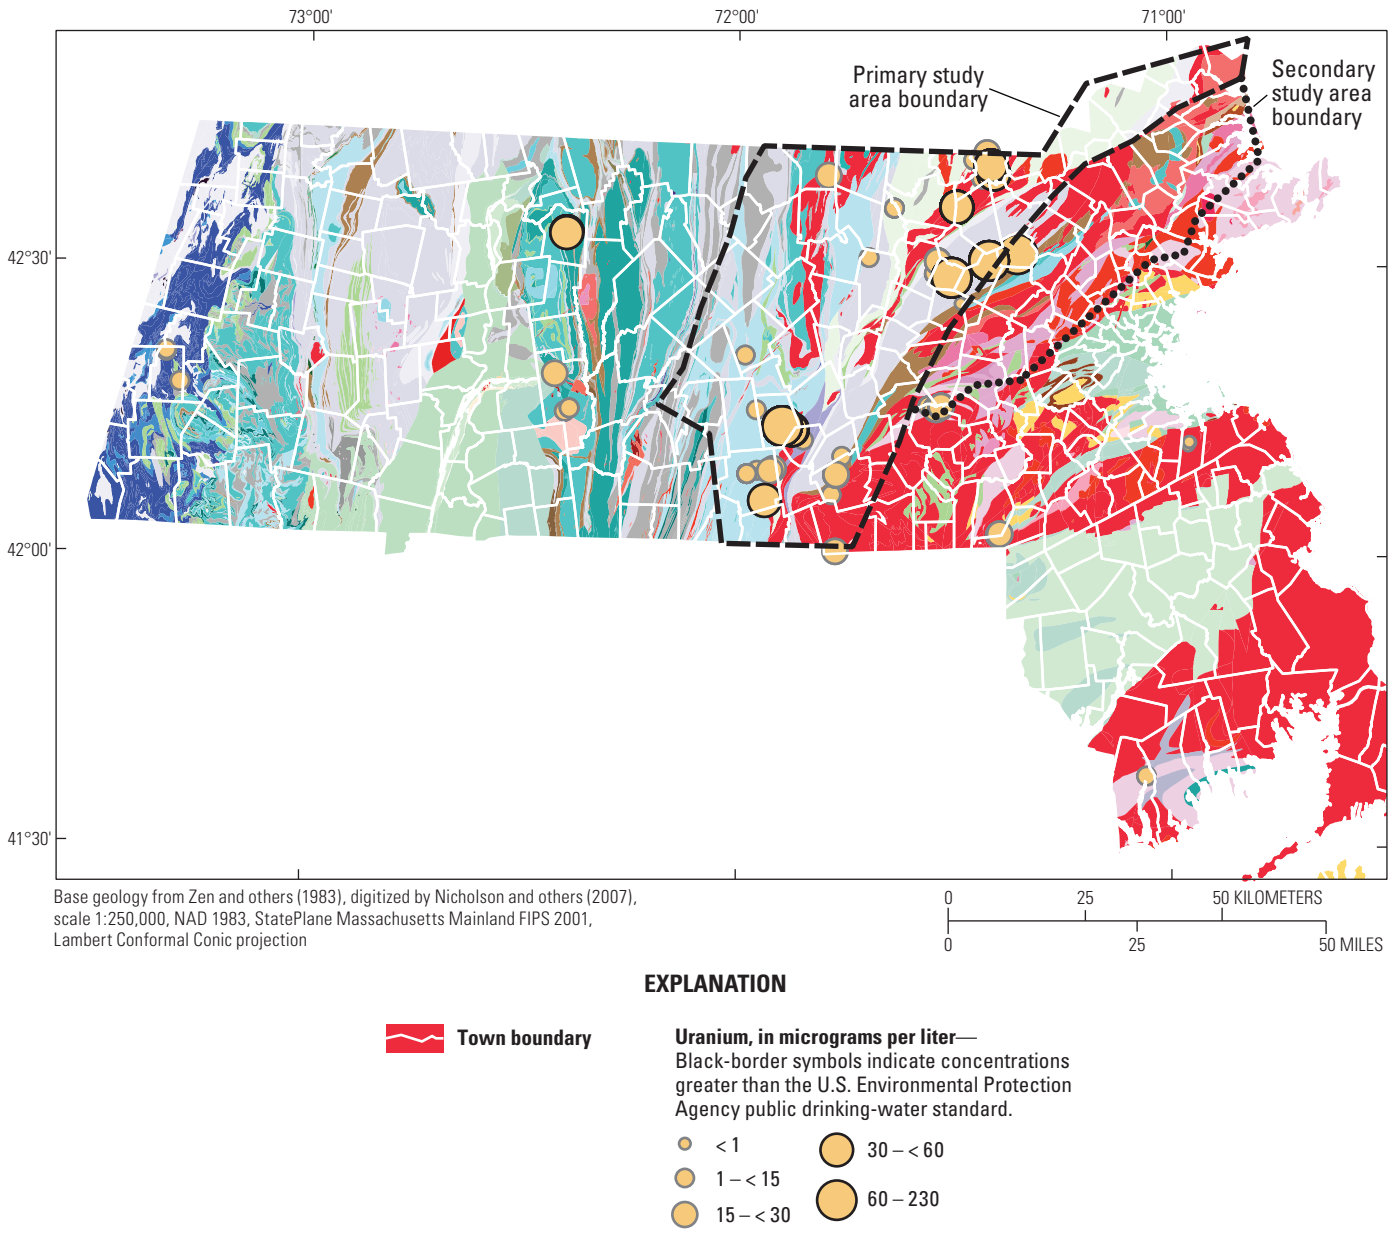

Figure 2. Uranium concentrations in public bedrock wells in Massachusetts, 2008. Data from the Massachusetts Department of Environmental Protection. See figure 3 and appendix 1 for explanation of bedrock units in the east-central part of Massachusetts. <, less than

objective for each rock type. A 50-percent return rate was expected, based on return rates from a similar investigation in New Hampshire (Montgomery and others, 2003). Well users were given 1 month to reply before a followup card was sent. If no reply had been received by 2 months after the followup card, the site was dropped from the study.

Sample Processing and Analytical Methods

All samples were collected by the residents living at the addresses selected for sampling. The samples were returned in a Tyvek® envelope by mail to the USGS office in Northborough, Mass. Samples intended for trace-constituent analysis were acidified to a pH less than 2 in the Northborough laboratory with 0.4-mL analytical-grade concentrated nitric acid (HNO_3). The acidified samples were sent to the USGS National Water Quality Laboratory (NWQL) in Denver, Colo., for analysis as listed in table 1. At the laboratory, samples were subject to an in-bottle acid digestion before analysis so that results represented total constituent values.

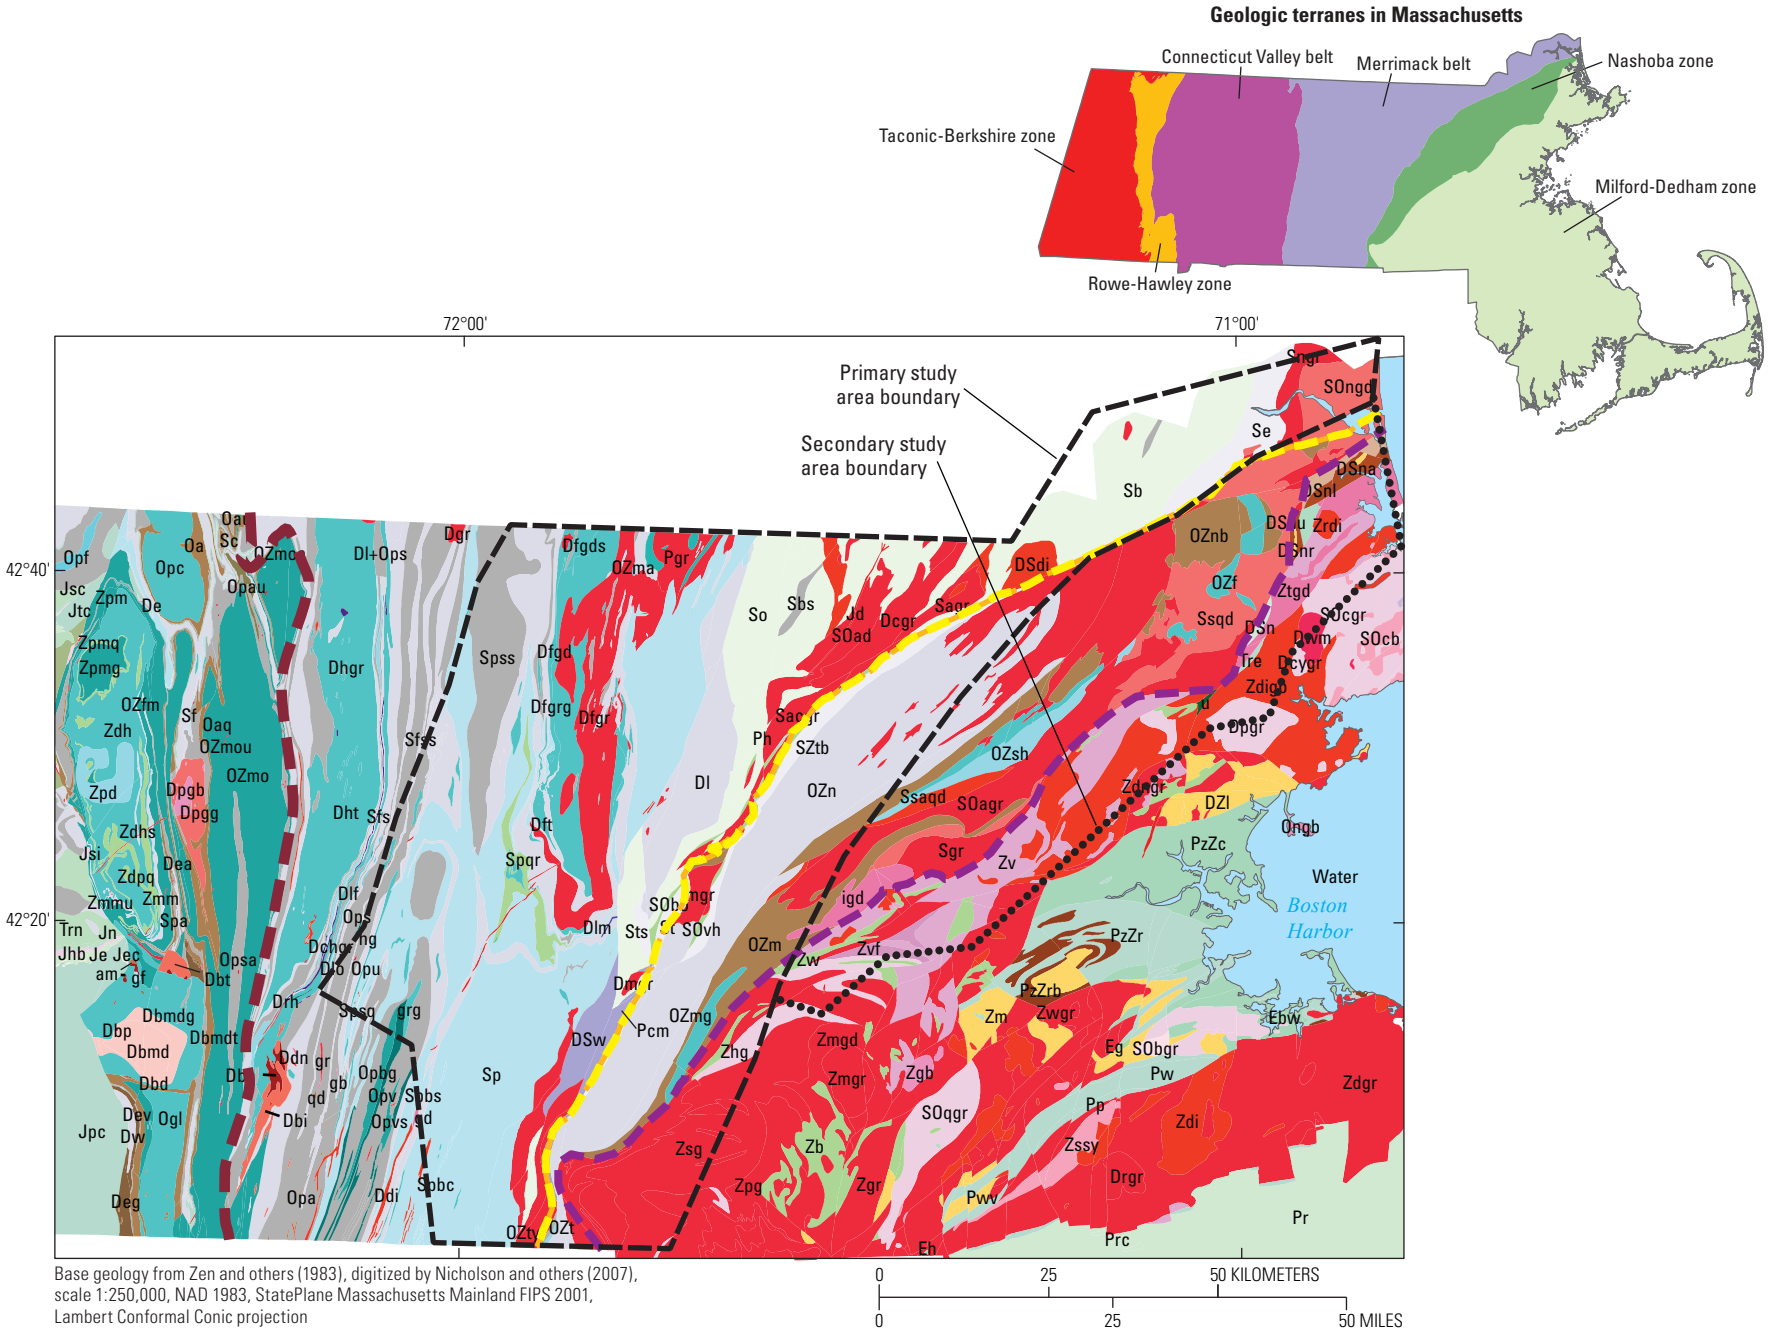
Supplemental Data

Additional data (1997 to 2007) on arsenic and uranium in bedrock wells were retrieved from the database of the MDEP (Joseph Cerutti, unpub. data, 2008) (figs. 1 and 2). The data were from analyses of water in public wells and were screened to include only data from bedrock wells. Although the results likely were relevant to the investigation, some differences prevented a simple combination of the data with that collected during this investigation. Different and multiple laboratories (State certified) were used for the analyses for MDEP data than were used for the USGS data. Greater water use may be expected from the public wells in the MDEP database compared to the private wells in the USGS database. The MDEP data were used to help define the areal distribution of arsenic and uranium but were not used in statistical summaries of occurrence of these constituents.

Statistical Comparisons

Parametric statistical tests were used, which are appropriate if normality or any other specific distribution (log normal in this investigation) can be assumed (Iman and Conover, 1983). Analysis of associations of concentration with bedrock unit was determined by one-way analysis of variance (ANOVA) on log-transformed concentration data, using the statistical software package Minitab 16®. Cumulative distribution functions with 95-percent confidence intervals were determined for concentration populations grouped by bedrock unit by fitting data to a log-normal distribution, using the statistical software package Minitab 16® with the options for distribution analysis, and arbitrary data censoring. For bedrock units with fewer than five analyses with concentrations exceeding the analytical reporting limit, the option to assume a common scale was used in the distribution fitting.

The statistical software package SPLUS® was used to compare geologic mapping techniques and the correlation with arsenic and uranium concentrations. The comparisons were made with a multiple linear regression of log-transformed data.



Arsenic and Uranium Concentrations and Correlations with Bedrock Units

The ranges and correlations of arsenic and uranium concentrations among bedrock units are the focus of this project. The project objective is to use the correlations to guide future well-water testing, treatment, and supply development.

Quality Assurance and Other Data Attributes

During the investigation, 60 quality-assurance samples were analyzed for iron, manganese, arsenic, and uranium. The quality-assurance samples included sampling-bottle and preservation-acid blanks, a standard-reference sample, resampling, duplicate sampling, and sample splits (table 2). Quality-assurance results of the blank samples showed that possible contamination did not occur during sampling, during sample handing, or from sampling materials (the bottles and preservation acid). All concentrations measured for the four sampling-bottle blanks during the study were below the reporting limits (table 1) for the respective analytes (table 2). Four samples of standard reference solution (USGS T-195) submitted to the NWQL as blind samples were generally within 5 percent of the known values. Average percent errors (average, in percent, of the absolute difference between replicate pairs divided by the average of the replicates) increased for all elements in the comparison series: split samples, duplicate samples separated by 5 minutes, and duplicate samples separated by months (average interval of 80 days). The error increase reflected variability in samples over time—small, but measureable for samples collected within 5 minutes, and larger for samples collected months apart.

Variability of concentrations over time was investigated by analysis of 48 duplicate samples. USGS personnel visited 12 randomly chosen wells where three samples were collected at each well: duplicate samples within 5 minutes and a third sample to compare with the original sample collected by the well user. Results showed that repeatability for samples collected sequentially at one visit was very good, but that substantial variation can occur for a well sampled over time (fig. 4). Sampling error from additional sources is possible in resampling over time, including the possibility of sampling from different water taps by mistake.

Return Rates for the Water Samples

Of the total 1,580 sample kits sent to well users, samples from 478 wells were returned, a 30-percent return rate. The low return rate resulted in several bedrock units that had too few samples for statistical analysis.

Water Use and Water Quality at Sampled Wells

Results from the returned questionnaires indicate that 91 percent of the respondents use their well water for drinking. Many users treat the water in some way including softening, radon removal, arsenic removal, and reverse osmosis. Of the respondents with wells having arsenic concentrations exceeding the drinking-water standard, however, 66 percent were using water for drinking without treatment. Of the respondents with wells having uranium concentrations exceeding the standard, 93 percent were using water for drinking without treatment. The statistic included one respondent that was not using the water for drinking because it had not been tested. Thus, none of the respondents with wells having uranium concentrations exceeding the standard were treating the water for uranium removal.

Arsenic Concentrations

Arsenic concentrations in the complete dataset ranged from less than 0.2 µg/L (less than the laboratory reporting limit) in 24 percent of all samples tested to 1,540 µg/L. Of the 344 randomly selected samples (excluding intensive quadrangle sampling), 13 percent exceeded the 10 µg/L drinking-water standard. For randomly selected samples from the primary study area, a slightly larger fraction of samples,

Table 2. Quality-assurance results for arsenic, iron, manganese, and uranium.

[USGS, U.S. Geological Survey]

Quality-assurance measure	Details	Number of samples	Result
Bottle blanks	Sample bottles had been sent out in mailers, and were preserved with acid	4	All concentrations were less than the method detection limit
Standard reference samples	USGS standard reference water sample, number T-195	4	Mean relative errors were Arsenic: 4.9 percent Iron: 2.4 percent Manganese: 0.62 percent Uranium: 5.6 percent
Sample splits	One sample split for two analyses	13	Mean relative errors were Arsenic: 3.8 percent Iron: 1.8 percent Manganese: 6.2 percent Uranium: 0.74 percent
Duplicates at one time	Samples collected sequentially on one sampling occasion	13	Mean relative errors were Arsenic: 5.8 percent Iron: 11.3 percent Manganese: 15.1 percent Uranium: 3.3 percent
Duplicates over time	Two samples collected on different sampling days	13	Mean relative errors were Arsenic: 49.5 percent Iron: 80.1 percent Manganese: 61.2 percent Uranium: 74.3 percent

15 percent, exceeded the standard. Concentrations of arsenic were not elevated in the 18 samples west of the primary study area, but some elevated concentrations were measured in the secondary study area, located east of the primary study area (fig. 5). Elevated concentrations can exist near low concentrations in the same bedrock unit, similar to distributions measured in other New England studies (Montgomery and others, 2003).

Arsenic Correlations with Bedrock Units

Arsenic concentrations in well water vary depending on the bedrock unit (fig. 6). Generally, concentrations are not narrowly distributed but rather extend above and below the median concentration for the bedrock unit by an order of magnitude or more. Although there are no bedrock units with elevated concentrations that do not also include low concentrations, there are some units with only low concentrations. One of the lowest-concentration units, Ops, is on the western edge of the study area, confirming the western limit to the elevated-concentration area in east-central Massachusetts. Each of the rock classifications of metamorphic, metamorphic with igneous intrusive, and igneous includes low-concentration and elevated-concentration units.

The variation within a bedrock unit indicates that median concentrations cannot be used for accurate predictions of concentrations in a unit. Concentrations in bedrock units are generally log normally distributed, so parametric statistical tests can be used to determine whether bedrock units and concentrations are related, or if distributions among bedrock units are significantly different. If a relation exists, probabilities of a bedrock well containing a given concentration may be calculated for each bedrock unit from cumulative distribution frequencies.

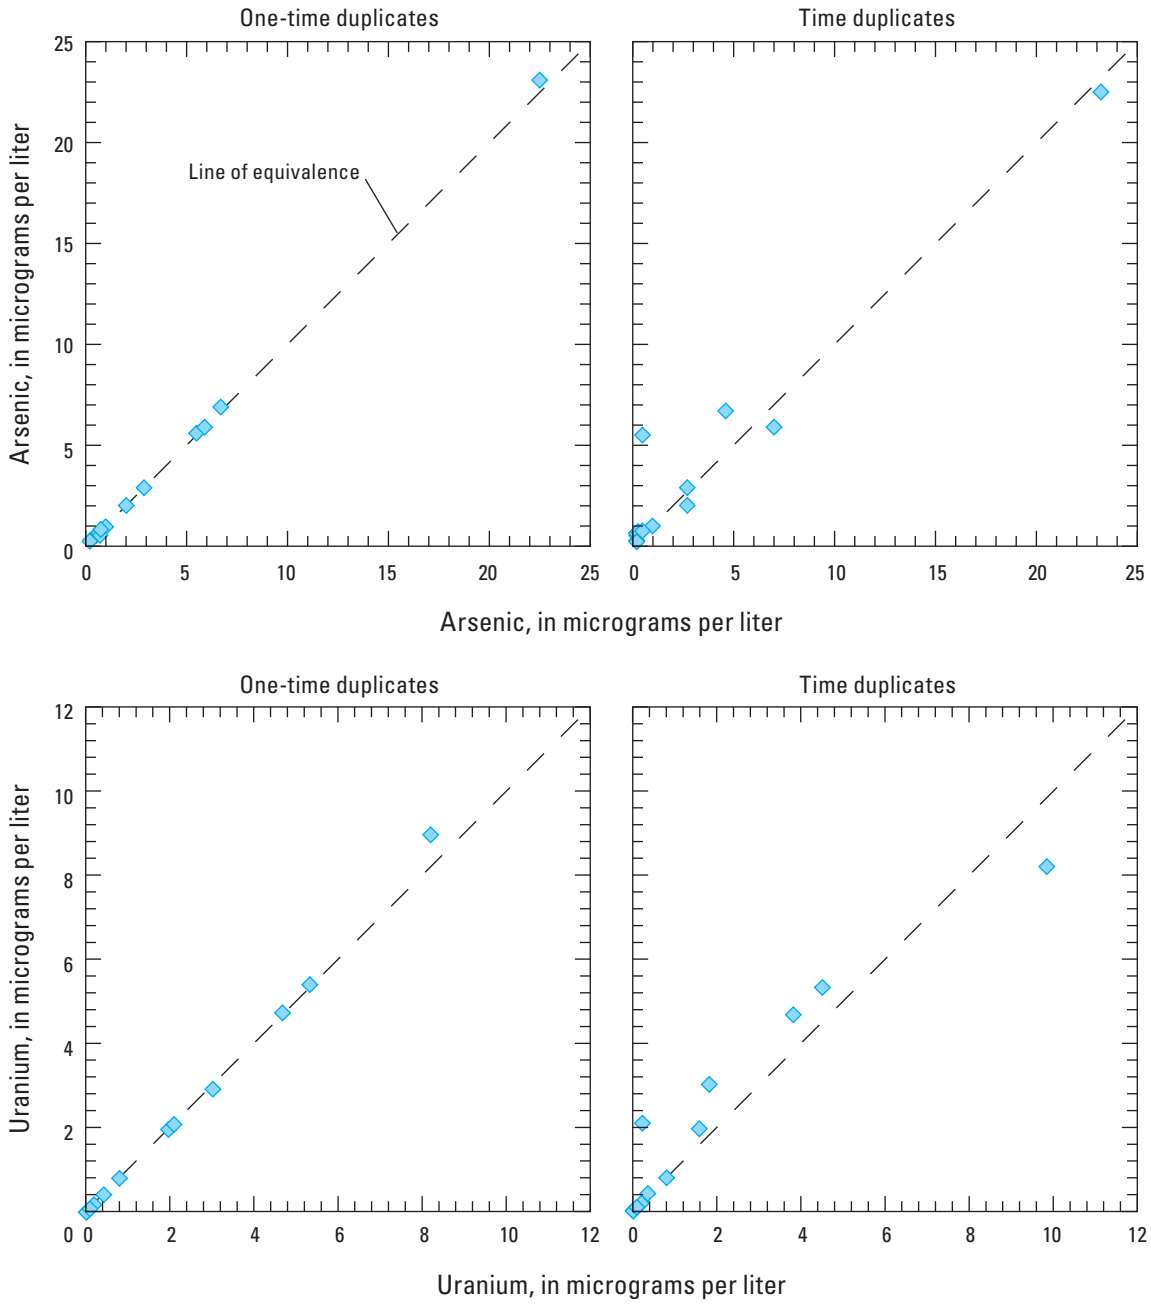

Figure 4. Arsenic and uranium sample duplicates collected on the same day and after about 80 days, east-central Massachusetts, 2009.

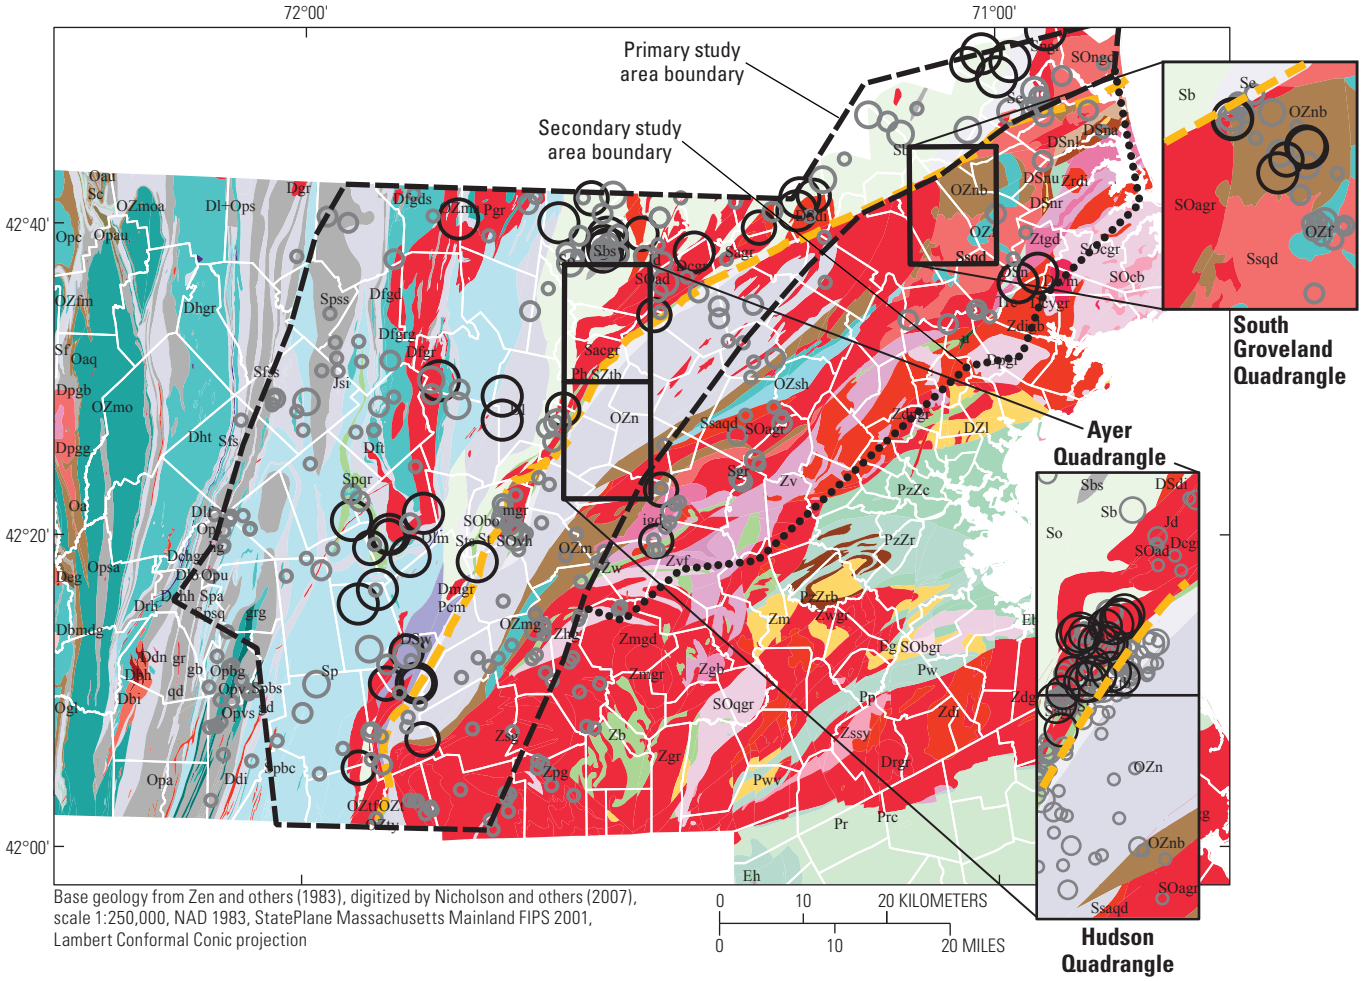

Figure 5. Arsenic concentrations in east-central Massachusetts, 2009. Sampling coverage was increased in the areas of the insert maps where geology was mapped at the 1:24,000 scale. See figure 3 and appendix 1 for explanation of bedrock units. <, less than

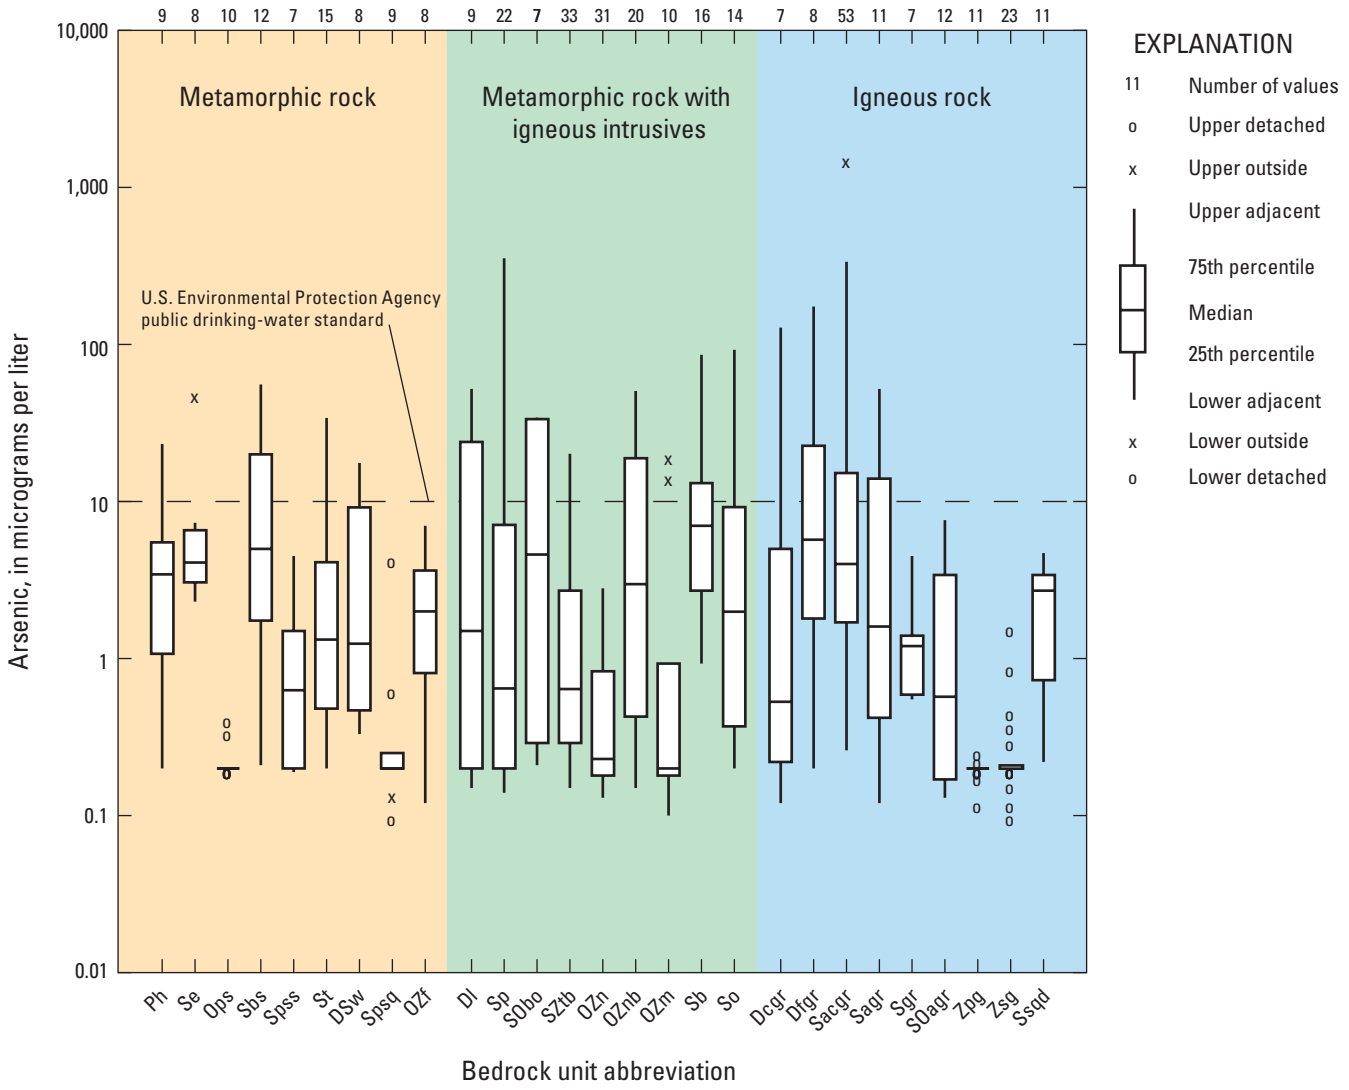

Figure 6. Distribution of arsenic concentrations by bedrock unit, with seven or more samples, in the primary and secondary study areas, east-central Massachusetts, 2009. See figure 3 and appendix 1 for explanation of bedrock units.

Arsenic concentrations north and west of the Clinton-Newbury fault are elevated (fig. 5). The fault marks a boundary between the Merrimack belt and Nashoba zone (fig. 3), and bedrock units do not extend across the fault boundary. The elevated arsenic concentrations extend approximately 20 km west and northwest of the fault. Within the 20-km zone, elevated concentrations were measured across a variety of bedrock unit rock types. Beyond the 20-km distance, sometimes within a rock type that has elevated concentrations near the fault, concentrations decrease. Lower concentrations of arsenic were measured in the large bedrock unit (OZn) east of the Clinton-Newbury fault. However, some elevated arsenic concentrations occur east of the fault, particularly in the OZnb unit.

An elevated-concentration area was defined as being bounded on the east by the Clinton-Newbury fault and extending westward to include all the concentrations measured greater than 10 µg/L (fig. 7). MDEP data were combined with the USGS data to define the western part of the elevated-concentration area. One-way ANOVA analysis was used to assess the relations between concentration and bedrock unit in the elevated-concentration area. Within the elevated-concentration area, there was no statistically significant difference at the 5-percent level between log-transformed concentration distributions, grouped by bedrock unit (fig. 8).

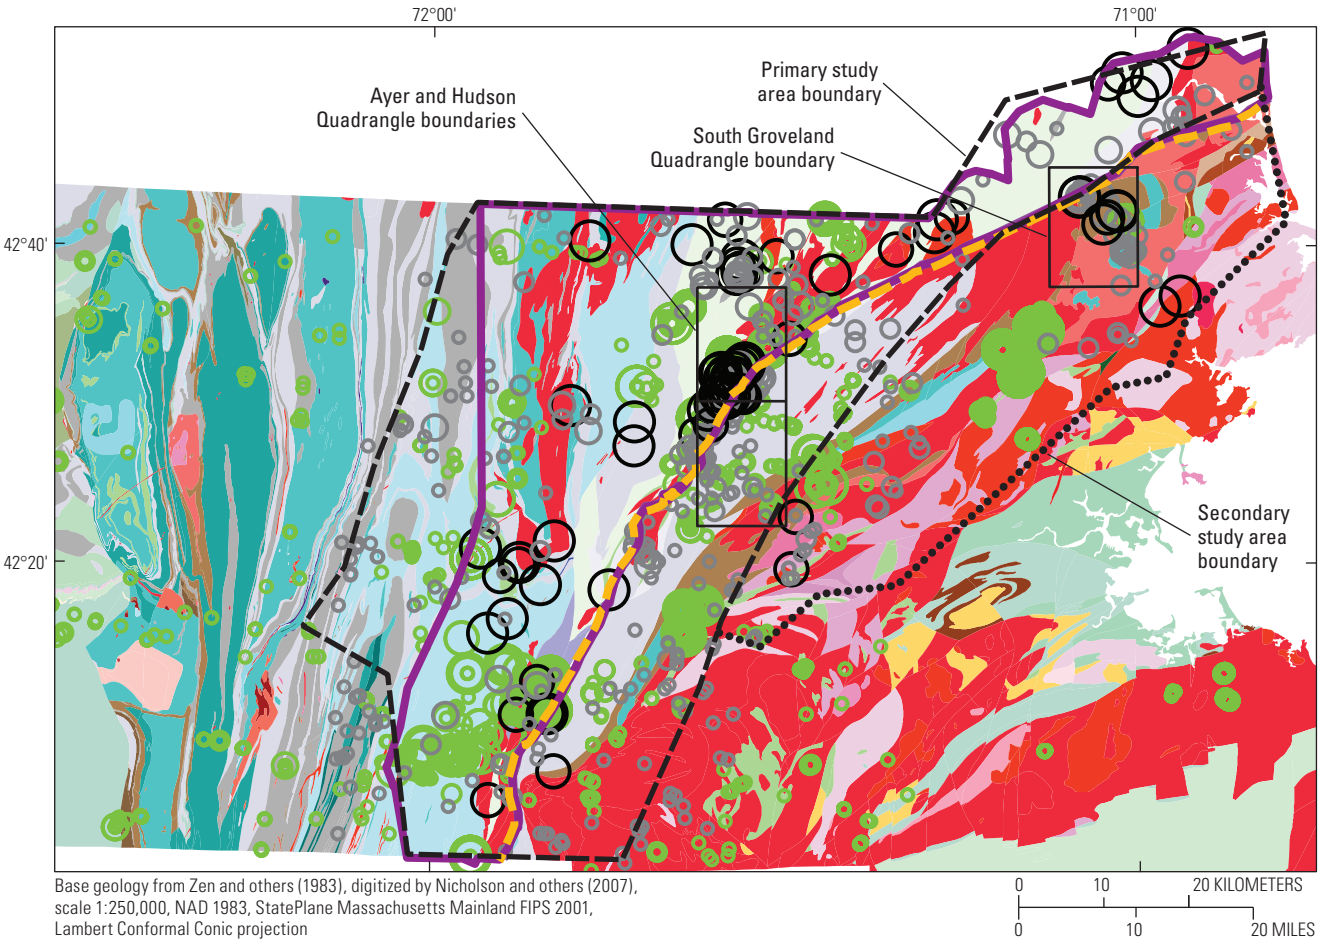

Figure 7. Arsenic concentrations, including Massachusetts Department of Environmental Protection data, showing elevated concentrations west of the Clinton-Newbury fault, east-central Massachusetts. <, less than

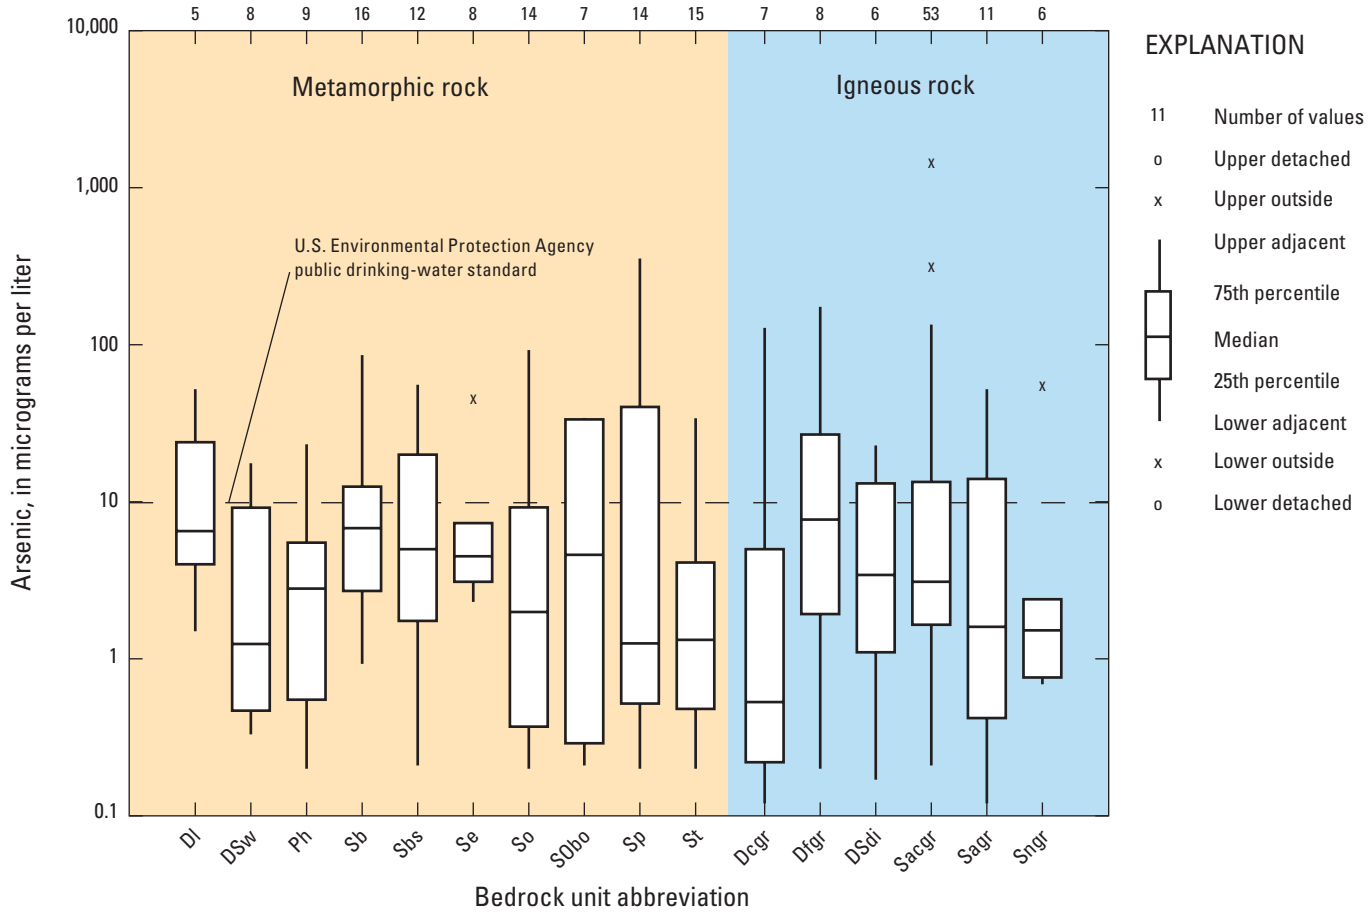

Figure 8. Distribution of arsenic concentrations by rock type in the elevated-concentration area, where differences in concentrations by unit were not significant, east-central Massachusetts. See figure 3 and appendix 1 for explanation of bedrock units.

Two of the bedrock units (Sp and Dl) inside the elevated-concentration area also extend outside the elevated-concentration area, where no concentrations exceeded the standard (fig. 9). Comparison of the data in the two units that cross the area boundary indicated that the difference across the elevated-concentration boundary, but within a bedrock unit, was statistically significant (fig. 10). These statistics indicate that the high-concentration area is within the Merrimack belt, but does not extend to the western boundary of the belt (fig. 9).

Three bedrock units with seven or more samples (Ops, Spss, and Spsq) were west or mostly west of the elevated-arsenic area. Concentrations in these bedrock units were significantly different from the grouped elevated arsenic area adjacent to the west.

A different pattern is observed east of the fault. Most striking is the difference between the bedrock unit SZtb, aligned with the Clinton-Newbury fault, and the bedrock unit OZn, adjacent to the east (fig. 5). Because of extra sampling in the area of the remapped quadrangles, there is an excellent

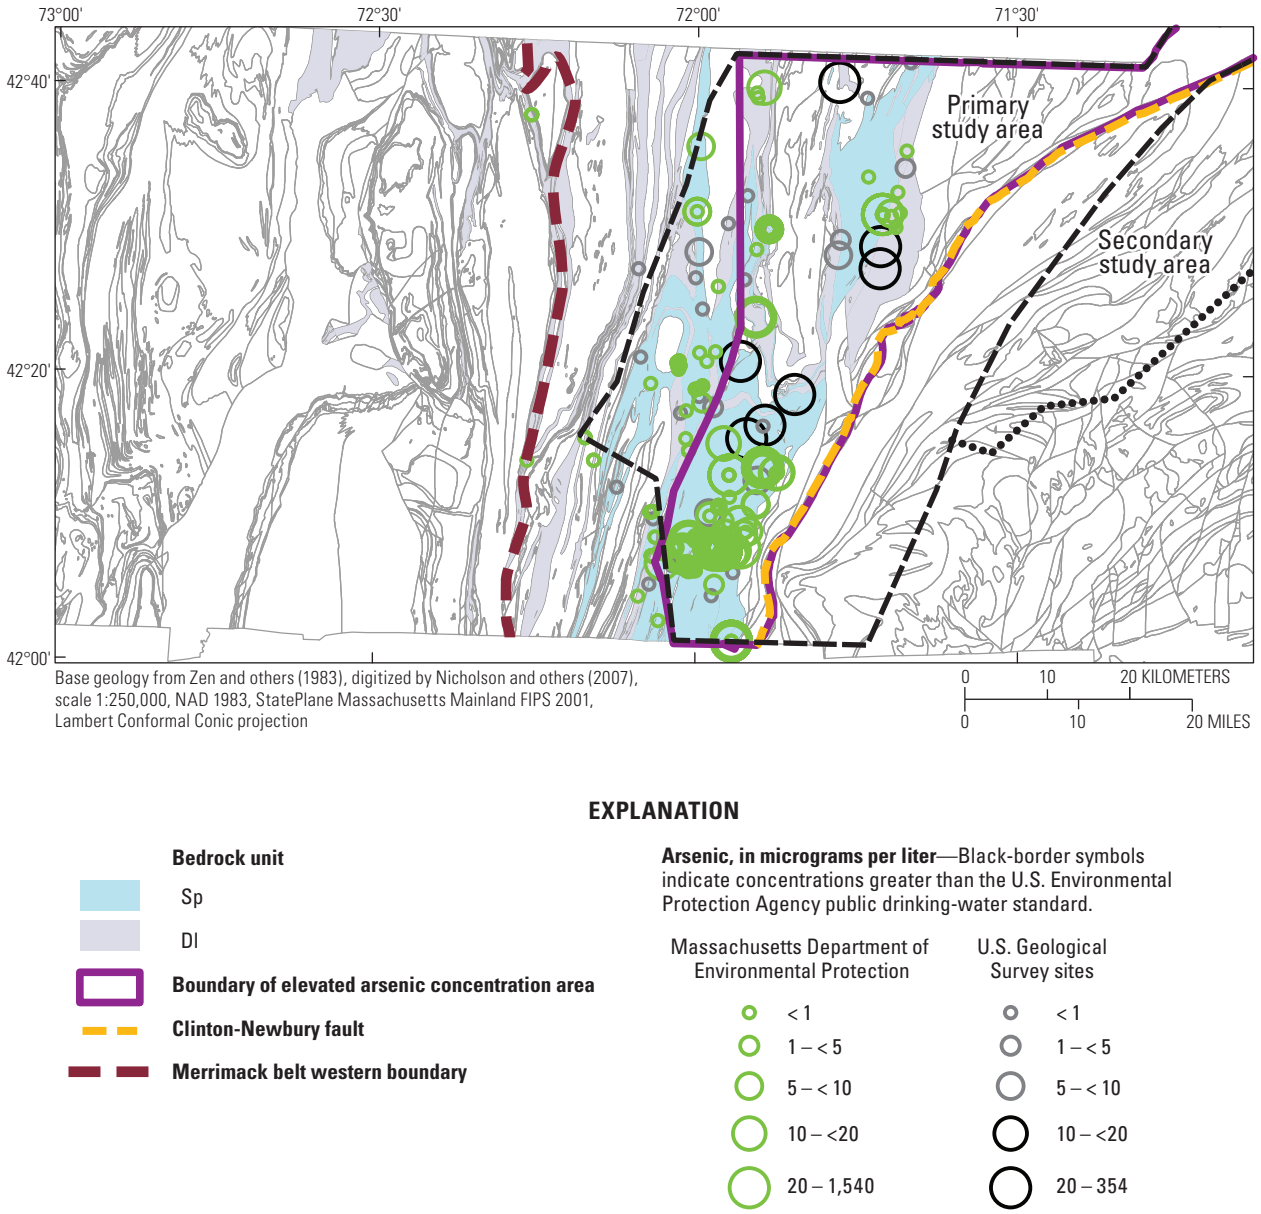

Figure 9. Arsenic concentrations inside and outside the elevated-arsenic area in bedrock units Dl and Sp. Data from the U.S. Geological Survey and the Massachusetts Department of Environmental Protection. See figure 3 and appendix 1 for explanation of bedrock units. <, less than

visual indication of arsenic concentration association with geology (inset map, fig. 5). One-way ANOVA analysis shows significant concentration differences between lower-concentration (OZn, Zhg, Zpg, Zsg, and Zw) and higher-concentration (SZtb and OZnb) units. The amphibolite-bearing rocks, OZnb, have elevated arsenic. Although not used for statistics, the MDEP dataset includes elevated concentrations in the southern parts of the amphibolite unit (fig. 7), which appears to indicate that the association is rock specific, not region specific as was found in the elevated concentration area in the west.

One-way ANOVA analysis of log-arsenic concentration in the rocks east of the Clinton-Newbury fault indicates that the arsenic concentrations in the OZnb unit are significantly higher than in the OZn unit (fig. 11). In this region east of the Clinton-Newbury fault, the mapped bedrock units indictate the distribution of arsenic concentrations. The OZnb unit extends well outside the primary study area and, as such, extends the area where elevated arsenic concentrations may be expected in Massachusetts from previous estimates (Ayotte and others, 2003).

Uranium Concentrations

Uranium concentrations ranged from less than the analytical reporting limit, 0.02 µg/L, to 817 µg/L. The low reporting limit allows description of uranium concentration variability in virtually all ranges of occurrence. Of 344 samples from the stratified random sampling, 12 samples (3.5 percent) exceeded the drinking-water standard of 30 µg/L. With the samples from the intensive sampling included, concentrations in 13 of the total of 478 samples (2.7 percent) were greater than the drinking-water standard. Elevated concentrations of uranium were widely distributed across the study area (fig. 12). As with arsenic, elevated uranium concentrations can be in close proximity to low concentrations in the same unit. Some units, however, had consistently low concentrations.

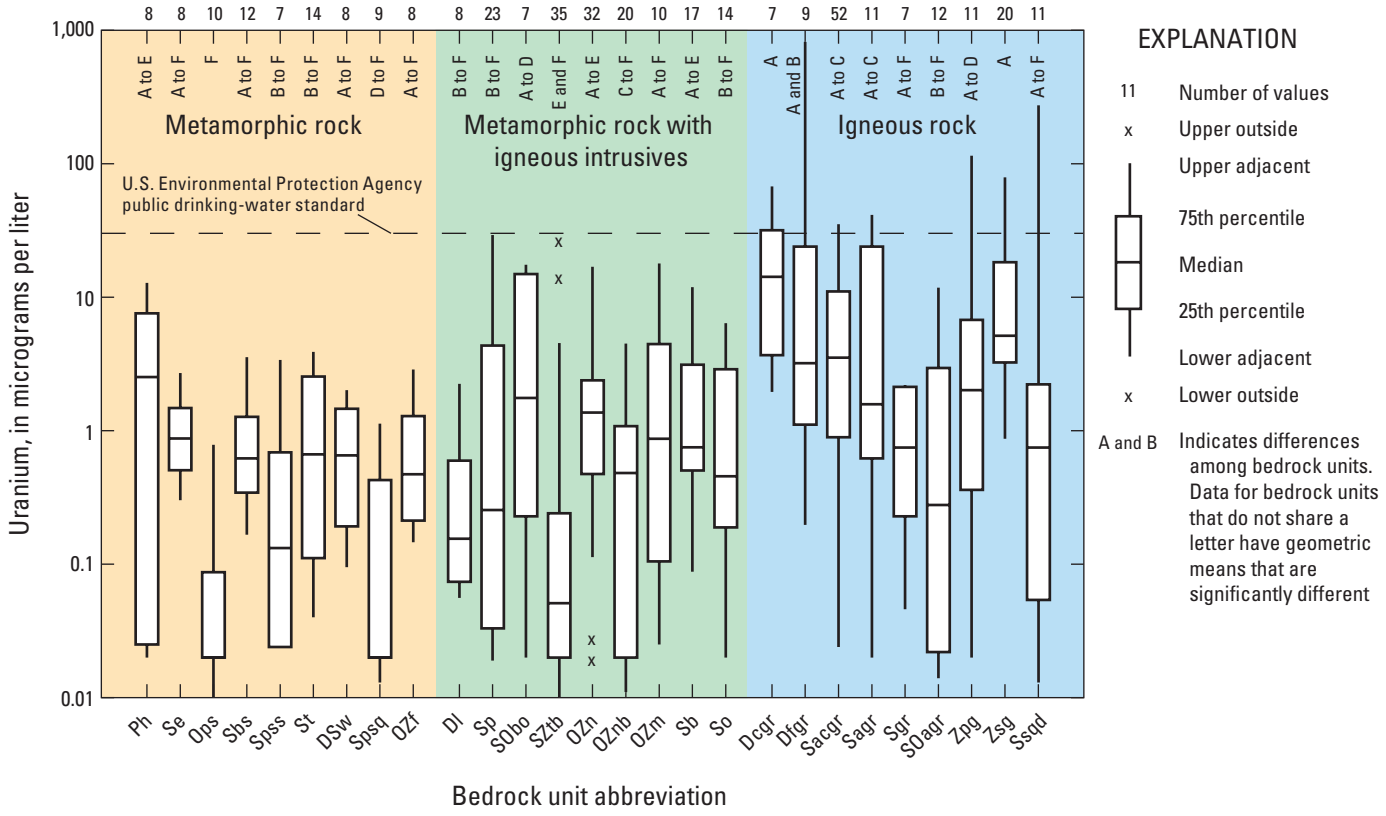

Figure 13. Distribution of uranium concentrations by bedrock unit, with seven or more samples, in the primary and secondary study area, east-central Massachusetts, 2009. See figure 3 and appendix 1 for explanation of bedrock units.

Uranium Correlations with Bedrock Units

Variation of uranium concentration by bedrock unit is apparent in units sampled seven or more times, a threshold used to increase statistical significance (fig. 13). Median concentrations are generally greater in igneous rock than in metamorphic rock (fig. 13). Concentrations in metamorphic rock intruded by igneous rock were intermediate. Concentrations were lowest in the unintruded metamorphic rock. Uranium concentrations exceeded the 30 µg/L drinking-water standard only in the igneous units.

The visual differences (fig. 13) were confirmed by one-way ANOVA analysis applied to the log-transformed uranium concentrations for bedrock units with seven or more samples, using rock type as a discrete independent variable. Significant differences were noted in concentrations among the rock types, indicating the association of rock type with distribution of uranium concentrations. Several bedrock units west of the Clinton-Newbury fault, such as Dcgr and Dl, were significantly different from each other.

Bedrock units classified as metamorphic, but intruded by igneous rocks, occasionally might be expected to reflect the elevated igneous concentrations. Well boreholes might intersect igneous rock even though the unit was classified as metamorphic, although this investigation did not find standard exceedences in metamorphic rock intruded by igneous rock. Intruded rock, however, did include concentrations that were greater than in unintruded rock.

Detailed Geologic Quadrangle Mapping of Bedrock Units

Several of the 1:24,000 quadrangles within the study area were remapped recently (three are shown in fig. 14). Some of the contacts between bedrock units are changed on the new maps compared to the State map (Zen and others, 1983; Nicholson and others, 2007). Bedrock unit identifications of some of the polygons also have changed. Correlations between arsenic and uranium concentration and the remapped units may be stronger than that of the State map if the newly identified units more accurately represent rock boundaries and if the concentrations are controlled by bedrock unit type.

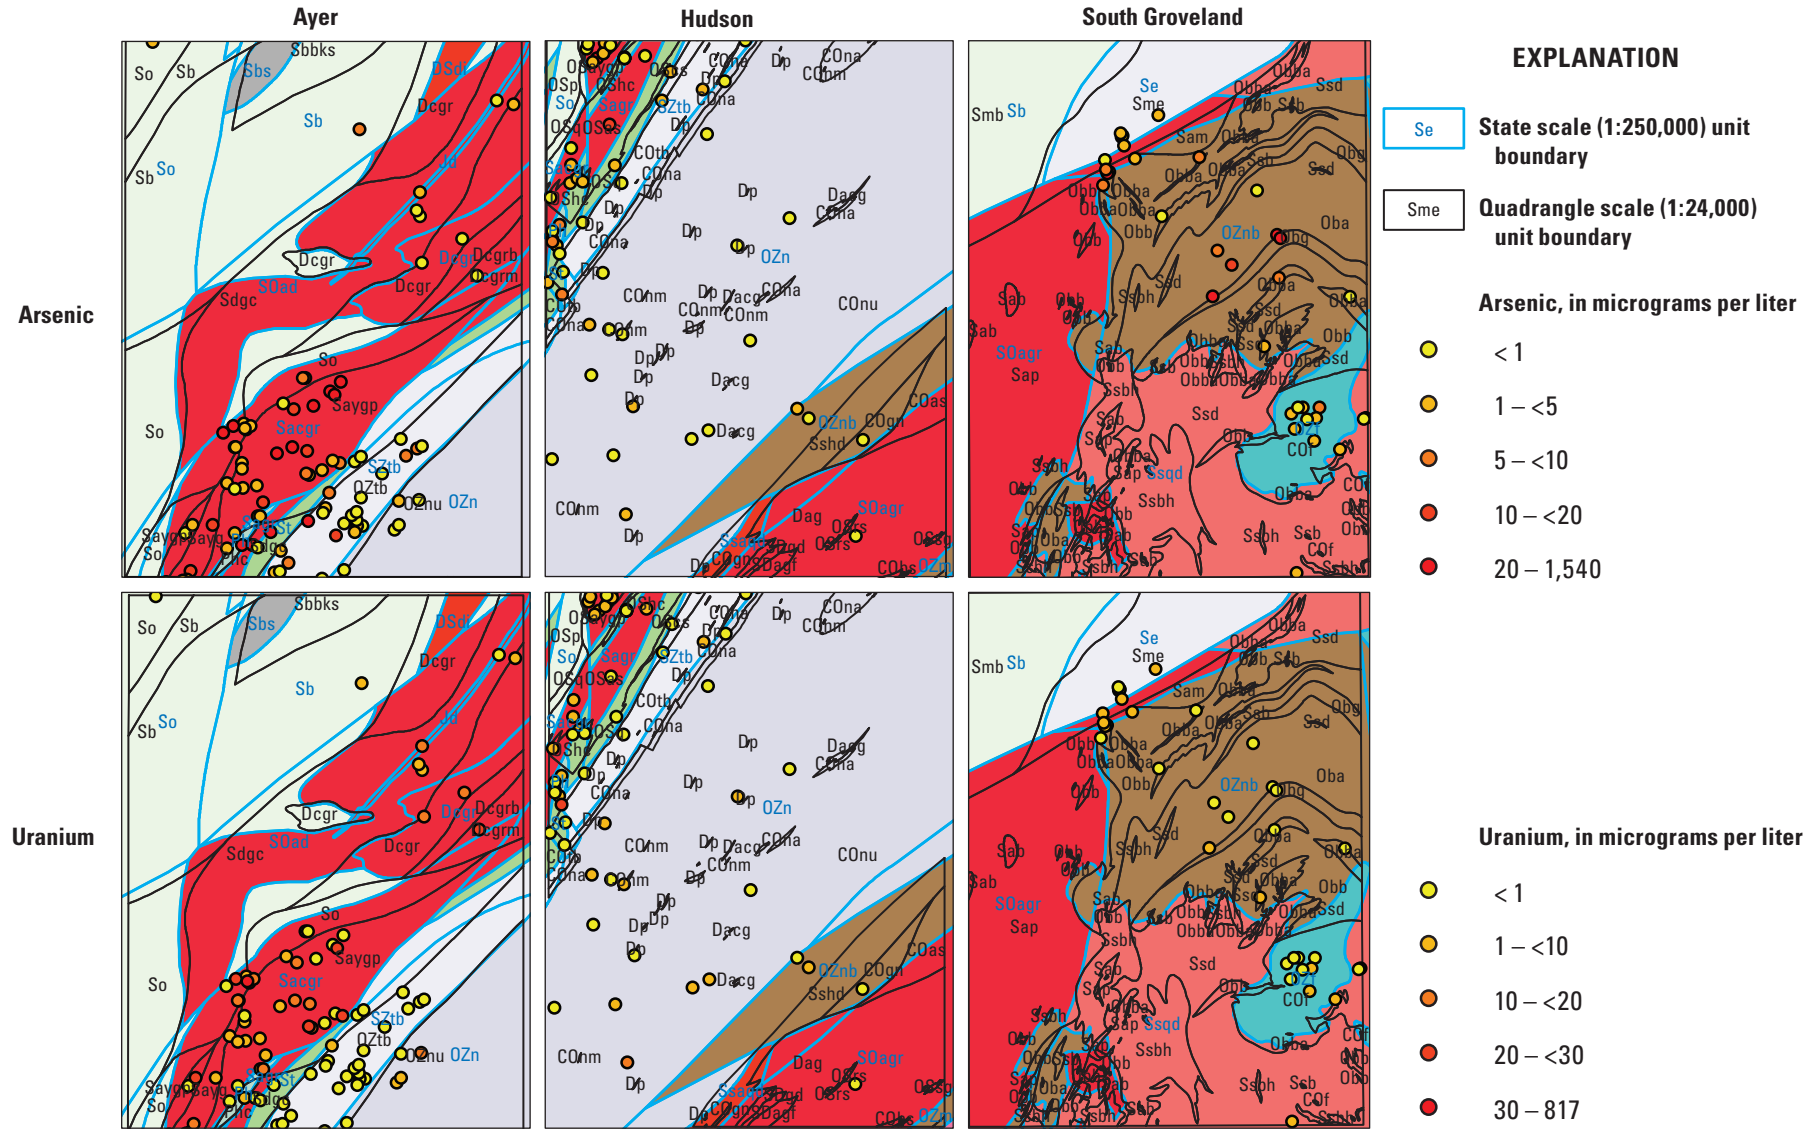

Figure 14. Details of change in geologic remapping of the Ayer, Hudson, and South Groveland 7.5-minute quadrangles compared to the statewide mapping of Zen and others (1983). <, less than

This effort reflects an attempt to test if the analysis of arsenic and uranium concentrations might be scale-dependent, as the 1:250,000 statewide map and 1:24,000 quadrangles differ significantly in scale. In New Hampshire, statewide analysis of well yield found that detailed (1:24,000) geologic maps improved the results of a predictive well-yield probability model over a statewide (1:250,000) model (Moore and others, 2002).

Correlations were compared by considering adjusted R-squared values for multiple linear regression of log concentration on bedrock unit for each pair of maps, that is, the map of Zen and others (1983) published in digital form by Nicholson and others (2007) compared to (1) the Ayer quadrangle (Kopera, 2006), (2) the Hudson quadrangle (Kopera, 2005) and (3) the South Groveland quadrangle (Castle and others, 2005) (table 3). Changes in renaming bedrock units alone would not change the value of the adjusted R-squared. Only a regrouping of well sites could change the R-squared value.

The adjusted R-squared value is a measure of the fraction of variance in the data that is explained by the regression variables. Results of the regressions indicate that no more variance of log-arsenic concentration is explained in the Ayer and Hudson quadrangles by the detailed (1:24,000) geologic mapping than by the statewide (1:250,000) mapping. For uranium, the adjusted R-squared value is about the same for the two mapping scales in the Ayer quadrangle but increases in the Hudson quadrangle with the 1:24,000 mapping. In the South Groveland quadrangle, more variance is explained with the new mapping than the old for both arsenic and uranium. One explanation for these results is the Clinton-Newbury fault that cuts though each quadrangle. In the Ayer and Hudson quadrangles, about half of the wells were in the elevated-arsenic zone where correlation with individual bedrock units was lacking. In the South Groveland quadrangle, only four wells were in the high arsenic zone, and all of these were in the same bedrock unit. Thus, arsenic would not improve with remapping for Ayer and Hudson because of a general lack of correlation by bedrock unit in much of the quadrangles. Uranium, by contrast, improved in two of the quadrangles with remapping and stayed about the same in the third. Overall, these results suggest that detailed mapping improves the ability to explain variance in uranium concentrations by bedrock unit, but that when variability in arsenic concentrations occurs at the terrane-scale, detailed mapping is less useful.

Table 3. Constituent correlation with bedrock units in statewide scale (1:250,000) and quadrangle scale (1:24,000), east-central Massachusetts.

[As, arsenic; U, uranium]

Geologic quadrangle	Regression	Adjusted R-squared	P value
Ayer	Log As, statewide scale	0.31	0.0001
Ayer	Log As, quadrangle scale	0.15	0.0198
Ayer	Log U, statewide scale	0.59	0.0000
Ayer	Log U, quadrangle scale	0.53	0.0000
Hudson	Log As, statewide scale	0.06	0.1952
Hudson	Log As, quadrangle scale	0.04	0.2997
Hudson	Log U, statewide scale	0.16	0.0225
Hudson	Log U, quadrangle scale	0.32	0.0010
South Groveland	Log As, statewide scale	0.03	0.3375

South Groveland	Log U, quadrangle scale	0.17	0.1006

Water-Quality Correlations with Ancillary Constituents

Analysis of ancillary constituents, acid neutralizing capacity, iron, manganese, and conductance was used to assess geochemical associations of arsenic and uranium occurrences. This was done using two-parameter plots (fig. 15). The plot matrix shows virtually no correlations among constituents. Some constituents appear to be mutually exclusive, particularly arsenic and iron, uranium and iron, and arsenic and uranium (fig. 15). This is in contrast to the relation found in overburden samples, where arsenic and iron are commonly correlated (Stollenwerk and Colman, 2003).

Peters (2008) attributes the difference in iron-arsenic association between overburden and bedrock as reflecting the lack of organic carbon likely present in bedrock units. Iron and arsenic associate in coatings deposited from oxic weathering of arsenic minerals, such as arsenopyrite. These coatings remain in place unless reducing conditions occur, such as associated with the presence of anthropogenic organic carbon (Stollenwerk and Colman, 2003; Peters, 2008). Iron concentrations were elevated in the water of some of the tested wells. The reducing conditions associated with these wells, however, were likely associated with sediments of wetlands or lakes that are providing recharge to the bedrock.

Bedrock Units, Geologic Terranes, and Geologic Sources of Arsenic and Uranium

The MDEP and the USGS data indicate that elevated arsenic in bedrock well water is associated primarily with two terranes in Massachusetts, the Merrimack belt and the Nashoba zone (figs. 1, 3, and 5). Within the terranes of elevated arsenic concentration, arsenic appeared to be correlated with bedrock

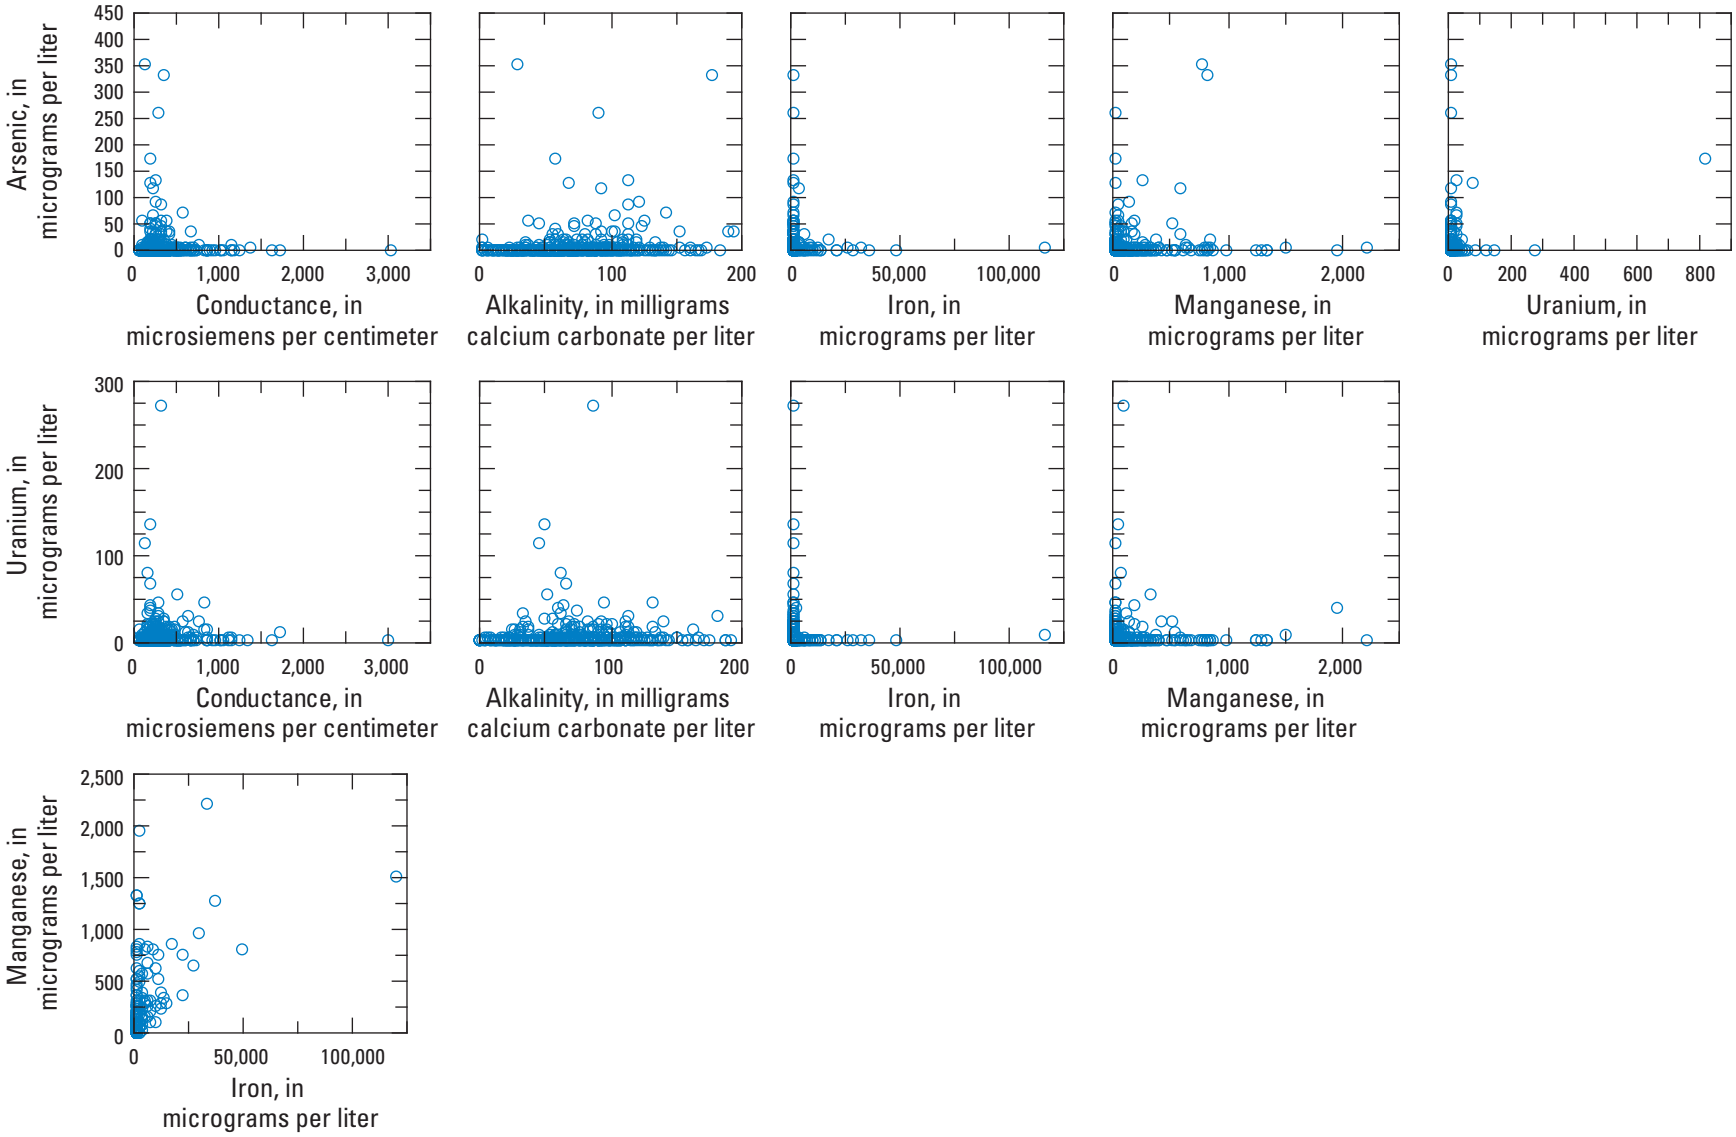

Figure 15. Associations among constituents measured in bedrock wells in east-central Massachusetts, 2009.

units in some parts of the study area and not correlated in other parts (note the elevated-concentration area of fig. 7). Sources of the arsenic in the areas that correlated with bedrock units could be in the rock protolith; however, the arsenic source in areas without bedrock correlation could have resulted from relatively equal redistribution of arsenic by metamorphic and/or metasomatic fluids from an original rock source (Henke, 2009). Although associated with the Merrimack belt, the elevated arsenic did not extend to the western border of the belt (fig. 9). The processes responsible for distributing the arsenic that is present in well water did not operate throughout the terrane.

In the Nashoba zone, where correlation between bedrock unit and arsenic concentrations was more prevalent, bedrock units with elevated arsenic extended to the Bloody Bluff fault, the eastern boundary of the zone. Two elevated arsenic concentrations were measured east of the Bloody Bluff fault in the Milford-Dedham zone, indicating that elevated arsenic concentrations are possible east of the Nashoba zone. Little previous data on arsenic in bedrock wells is available from this area where much of the water supply is public.

In the north, the elevated-arsenic area in Massachusetts abuts New Hampshire towns included in the private bedrock-well study by Montgomery and others (2003). In contrast to Massachusetts where units were grouped for concentration-probability analysis, units were grouped by fraction of samples greater than 10 µg/L in the New Hampshire study. The different statistical approaches prevent exact comparisons of data between the two States. Clearly, however, both States have elevated arsenic concentrations in the border area.

The association of igneous rock with uranium results from its deposition during magma cooling (Keevil and others, 1944). Uranium is one of the last elements to come out of solution, and it associates with rock surfaces from which mobilization into well water can occur. A report on uranium potential in two-mica granites of New England indicates that certain mineralized granites in New Hampshire and Massachusetts contain secondary uranyl-phosphate minerals (Boudette, 1977). Mobilization of uranium can occur in oxic conditions that are common in New England bedrock aquifers.

Maps of Estimated Probability for Elevated Arsenic and Uranium in Groundwater

Arsenic

Determination of probability of wells yielding water with arsenic concentration greater than the USEPA public drinking-water standard (10 µg/L) could help guide development of new supplies—domestic and public—and the testing of existing wells. Because of correlations of arsenic with bedrock unit and with groups of bedrock units described in a previous section on correlations, concentration distributions can be defined by bedrock unit. Cumulative distribution functions can be used to determine overstandard probabilities as well as probabilities of wells yielding water at levels of concentration greater than any given value (fig. 16). The distribution for each unit fits a log-normal distribution, and 95-percent confidence intervals based on the log-normal distribution can be computed (apps. 3 and 4).

The confidence interval of probability estimates depends on the number of samples for the bedrock unit and the concentration for which the probability is of interest. Probability distributions based on randomly selected samples of a population become more accurate as the sample size gets larger. Therefore, confidence intervals are a function of the number of samples. Finally, the probabilities can

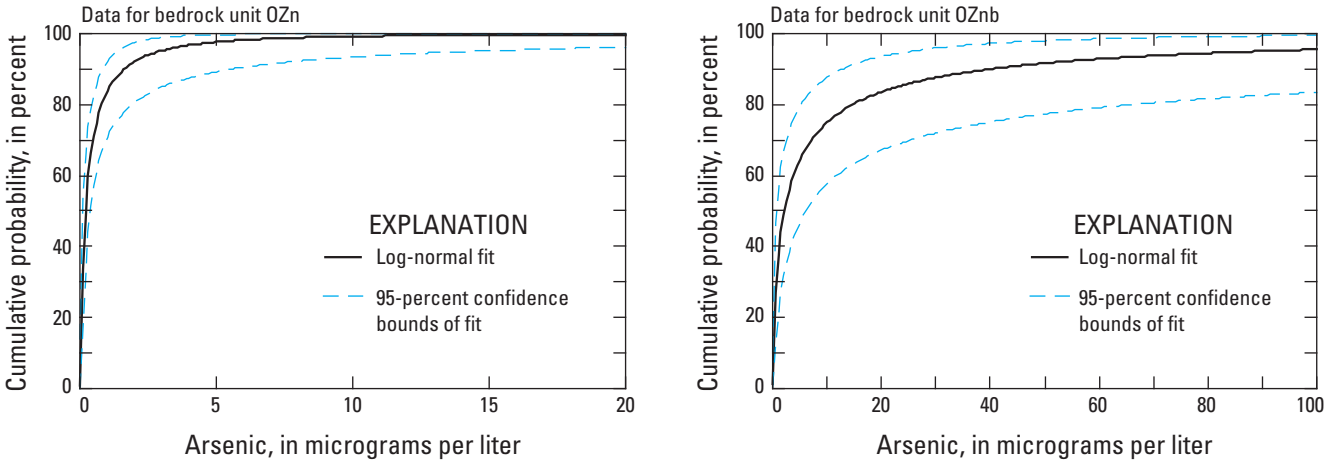

Figure 16. Cumulative probabilities for arsenic for two bedrock units east of the Clinton-Newbury fault.

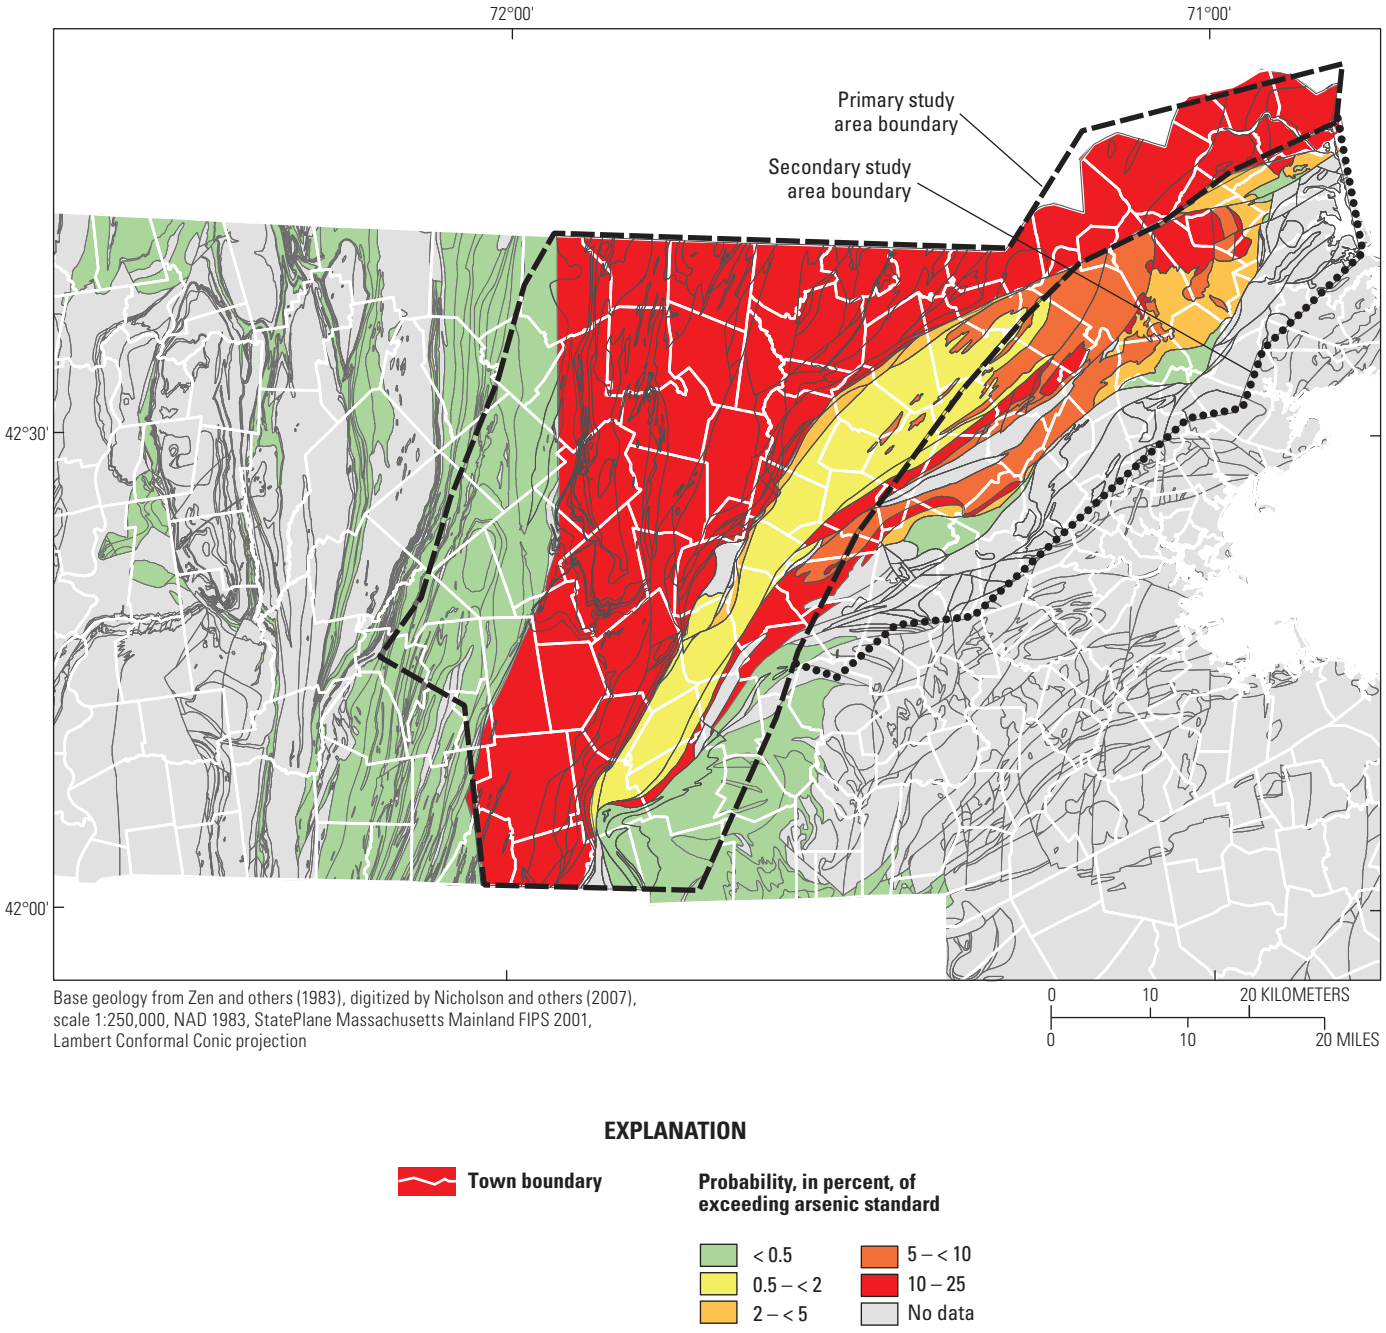

Figure 17. Probabilities of arsenic concentrations in bedrock well water being greater than 10 micrograms per liter, the U.S. Environmental Protection Agency drinking-water standard for public supplies, east-central Massachusetts. <, less than

be mapped so that areas with higher or lower probabilities of concentration than a given level (such as the USEPA drinking-water standard for public water supply) can be known (fig. 17). For example, the probability that a well in the OZn bedrock unit will contain water with an arsenic concentration greater than 10 µg/L (equal to 100 percent minus the cumulative probabililty) is low—0.79 percent with 95-percent confidence interval of 0.05 to 6.6 percent (fig. 16 and app. 3). The probability that a well will contain water with arsenic concentration greater than 10 µg/L for OZnb, an elevated-concentration unit, is 26 percent with a 95-percent confidence interval of 13 to 43 percent.

Bedrock units in the elevated-concentration area (fig. 7) were grouped for computing cumulative probabilities. The probability of well water being greater than 10 µg/L for the elevated-concentration grouping of units was 23 percent, exceeded only by OZnb at 25 percent.

Uranium

In this study, uranium is more generally correlated to bedrock unit than is arsenic, so uranium associations can be mapped exclusively by bedrock unit. Distributions of uranium concentration in a bedrock unit are log normal. Cumulative log-normal distributions indicate the probability of concentrations occurring for the whole range of concentrations, including the probability of exceeding 30 µg/L, the USEPA drinking-water standard for public supplies. The 95-percent confidence intervals of the probability estimates can also be determined from the log-normal fits (fig. 18, apps. 5 and 6). The uncertainty of the predictions—that is, the size of the confidence interval—decreases at high and low ends of the concentration range (fig. 18).

Example probabilities of encountering a concentration greater than 30 µg/L (fig. 18) range from 0.0001 percent (95-percent confidence interval of 0.0 to 0.005 percent) for Ops, to 21 percent (95-percent confidence interval of 5.5 to 50 percent) for Dcgr. Areas with granitic rock have higher probabilities (figs. 5 and 19).

Estimates of the Number of Wells that Exceed USEPA Drinking-Water Standards

Estimates of the number of wells affected can be determined by the product of the probability for well water to exceed the USEPA standard and the estimated number of wells per bedrock unit.

Estimates of private well distributions were made for the MDPH by Weston & Sampson Engineers, Inc., during 2005 (fig. 20). Potential private wells were identified by cross-referencing addresses in property-tax-assessment databases

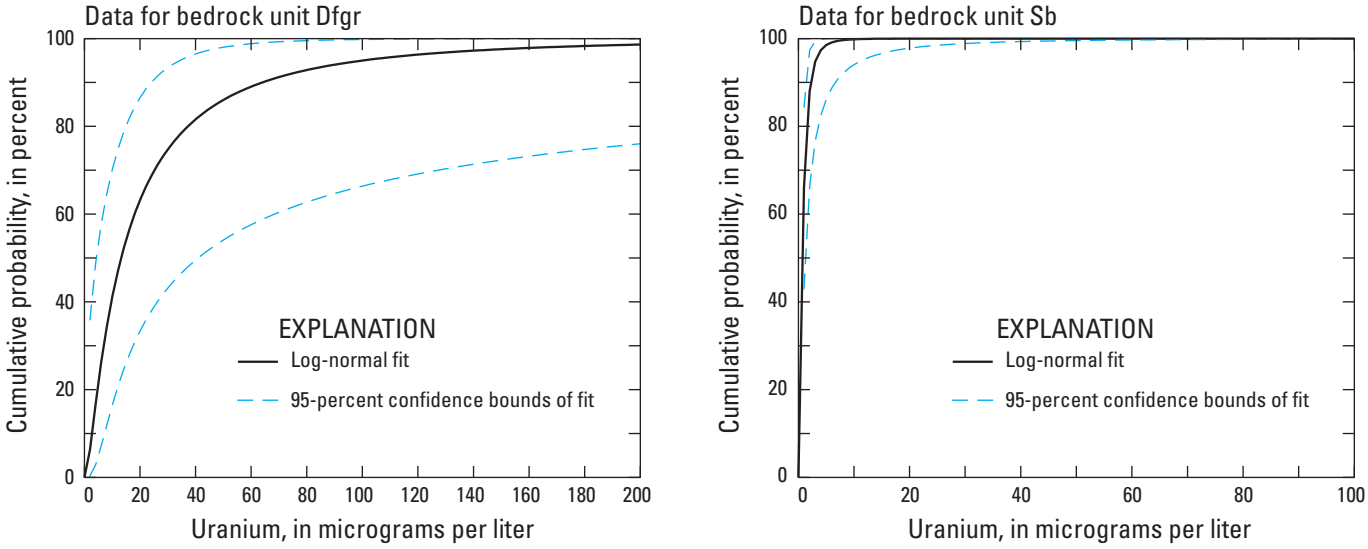

Figure 18. Cumulative log-normal distribution functions for uranium in an elevated-concentration bedrock unit, Dfgr, and a low-concentration bedrock unit, Sb, east-central Massachusetts.

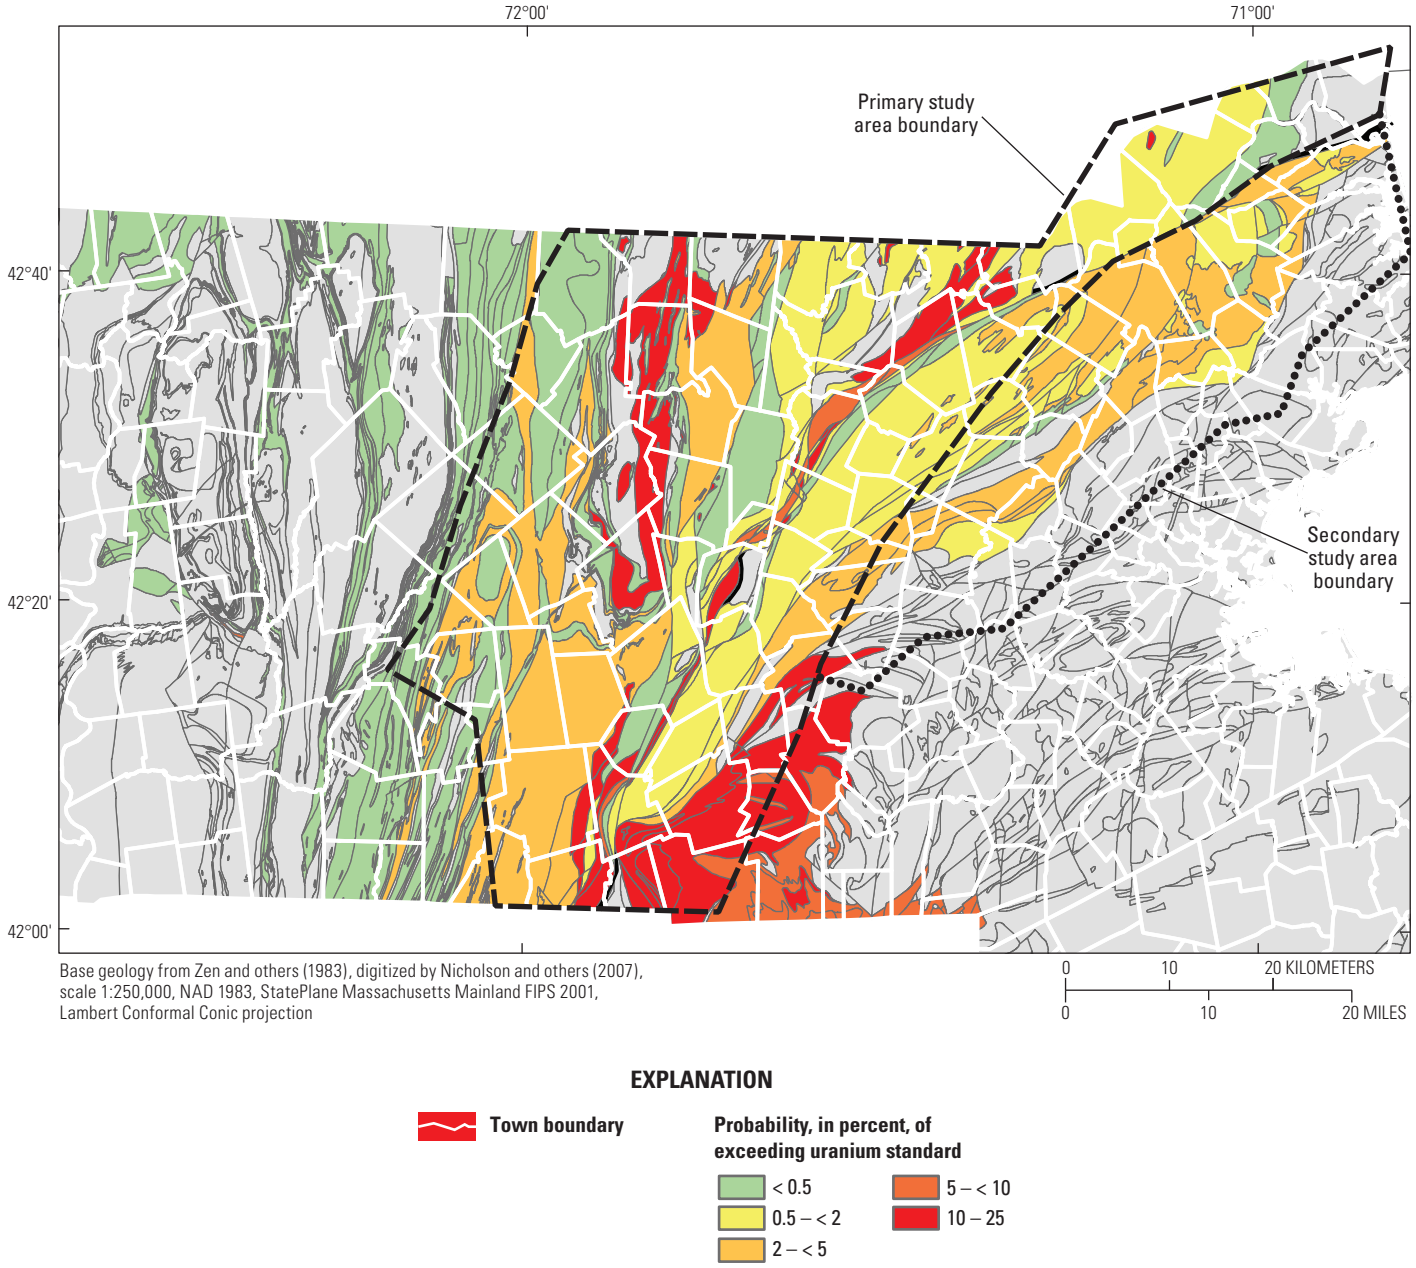

Figure 19. Probabilities of uranium concentrations in bedrock well water being greater than 30 micrograms per liter, the U.S. Environmental Protection Agency drinking water standard for public supplies, east-central Massachusetts. <, less than

with those in water-billing databases. The addresses in the tax-assessment databases that did not have a match in the water-billing databases were classified as potential private wells. In communities not served by a public water supply, all addresses contained in the tax-assessment data were classified as potential private wells. For the purposes of the estimate, all the inferred private wells were assumed to be bedrock wells. All the potential private well addresses were geocoded using the GDT/TeleAtlas Batch Geocoding Service®.

Not all towns in the study area were included in the MDPH inferred private-well investigation (fig. 20). The 1990 census, which provided information about households per census track and percentage of households on public or private water, was used to supplement well estimates in locations not covered by MDPH (U.S. Census, 1992). The census areas in towns not covered by the MDPH study were intersected with the bedrock data using Geographic Information System (GIS) techniques to delineate parts of census tracts that were in each

bedrock unit. The number of wells per census tract was then adjusted by the proportional area of the tract that was in the bedrock unit. Finally, all the wells in the parts of tracts in a bedrock unit were added to determine the number of wells in each unit. The number of wells estimated to exceed a standard was determined by multiplying the probability of exceeding a standard for that bedrock unit by the sum of the number of wells determined from the MDPH assessment and the census assessment (table 4).

Arsenic

For arsenic, no probability was given in table 4 for bedrock units that were within the elevated-arsenic area. Rather, the probabilities for the units in this area are covered by the grouped-units estimate (top of table 4).

The number of wells with arsenic concentrations that exceeded the USEPA drinking-water standard was estimated to be 5,741. Because the study area covered most of the known elevated-concentration areas for the State, this estimate is likely appropriate for the entire State. Several small units within the study area did not have enough data for probability statistics to be computed; however, these would not greatly alter the total.

Uranium

For uranium, correlations were strictly with bedrock units rather than grouped units (table 4). The number of wells with uranium concentrations that exceeded the standard for uranium was estimated to be 3,277. Most of these wells are in igneous rock. Because units west of the Clinton-Newbury fault were not grouped on an areal basis for uranium, several more bedrock units were excluded from the calculation of probability statistics than for arsenic.

Igneous bedrock units in Massachusetts are not confined to the primary and secondary study areas of this investigation. The statewide number of wells affected by uranium is likely larger than the number reported herein, based on the bedrock units in the study areas.

Implications for New Supplies, Testing, and Treatment

Locating Future Bedrock Water Supplies

Few private well owners have options regarding choosing locations that have favorable bedrock. For private supply, the probability maps (figs. 17 and 19) can be used to guide well-water testing.

Although the data collected were from private wells, the data could be used to assess conditions likely in public as well as private bedrock water supplies. Commonly, there are several site options for locating public wells. Consideration of the bedrock unit when selecting sites for public supplies could result in substantially decreased probabilities of concentrations exceeding the drinking-water standard. Towns that straddle the Clinton-Newbury fault, such as Harvard and Westford, could make use of the result that there is a lower probability of elevated arsenic concentration in the rocks east of the fault than those to the west.

Directing Resources for Water Testing

The numbers of overstandard water supplies without treatment can be computed by using the fraction of households currently using water without treatment for arsenic (66 percent of 5,741 = 3,789) and uranium (93 percent of 3,277 = 3,047). If testing could be directed toward the elevated-concentration areas, these numbers of untreated supplies would presumably decrease. By testing all wells that are in bedrock units with probabilities of elevated arsenic concentration greater than 10 percent, 90 percent of the wells exceeding the standard could be identified. Applied to data collected in this investigation, for example, all but two wells exceeding the standard (which are in SZtb with concentrations of 10 and 20 µg/L) would have been tested. This approach is likely to include testing of the highest concentration wells, because the elevated concentrations are associated with bedrock units that have the highest probabilities of overstandard concentrations. For example, of the two wells that were missed by this approach, one had a concentration at the standard and one had a concentration twice the standard; the highest concentration well tested in this study had a concentration 150 times the standard.

Because health risk increases with increasing concentration, a testing routine that likely includes the highest concentrations is beneficial. The 10-percent probability testing algorithm would result in testing 26 percent of all the wells estimated to be in the study areas. As a fraction of wells statewide, the percentage of wells tested would, of course, be much smaller.

For uranium, to determine 90 percent of wells greater than the standard, all units with overstandard probability of 4 percent or greater would need to be analyzed. This would involve testing about 40 percent of the wells in the study area.

Defining Natural Background Concentrations

A problem for site-contamination assessment in areas where arsenic occurs naturally is whether concentrations at a given site are caused by natural conditions or are the result of human-induced activity. In cases where there is a possibility that the bedrock has been contaminated with anthropogenic arsenic, the distribution frequencies of concentration for a given bedrock unit could be used to assess whether or not the distribution frequency of concentration at a site that is suspected of contamination is significantly different from natural conditions.

Summary

This investigation is the first regional-scale study of arsenic concentrations in water from private wells completed in bedrock throughout east-central Massachusetts, the region of elevated-arsenic concentrations in the State. Measurements of uranium concentrations also were included in the investigation, because uranium, similar to arsenic, likely has a bedrock source. Although private water supplies are not subject to new U.S. Environmental Protection Agency (USEPA) drinking-water standards for public-water supplies, such as those established for arsenic and uranium in the last 7 years of 10 and 30 micrograms per liter, respectively, the standards are thresholds whereby private well users can assess the need for water treatment. Concentration data are needed for arsenic and uranium concentrations to (1) assess the geographic distribution of elevated concentrations, (2) guide testing of existing supplies, and (3) develop new supplies. These needs were addressed by correlating concentrations of arsenic and uranium with bedrock units and applying the correlations to the mapped distributions of wells. For arsenic, the number of overstandard wells estimated by these methods in the study area would account for most of the overstandard wells in the State. For uranium, the number of overstandard wells estimated for the study area would be less than the total for the State, because bedrock units with elevated concentrations of uranium are also expected outside of the region of this study.

Samples were collected by private well users that responded to sampling kits that were mailed to randomly selected well addresses. An instruction sheet and water-use questionnaire were included in the sampling kit. Of the wells randomly sampled, 13 percent had concentrations that exceeded the drinking-water standard for arsenic, and 3.5 percent exceeded the drinking-water standard for uranium.

One-way ANOVA analysis of log-transformed concentration data indicated significant differences for arsenic and for uranium concentration populations grouped by bedrock unit in most of the study area. However, an area of elevated arsenic concentrations was identified west of the Clinton-Newbury fault, where there were no significant differences in arsenic concentrations among the bedrock units. Lack of correlation with individual bedrock units in this area could have resulted from relatively equal redistribution of arsenic by metamorphic and/or metasomatic fluids.

Concentrations of arsenic and uranium fit log-normal distributions for populations separated by bedrock unit. For each bedrock unit, log-normal fits of the data were used to determine probabilities of concentrations exceeding the drinking-water standards. Overstandard probabilities were as great as 26 percent for arsenic in a unit containing amphibolite and 21 percent for uranium in a granitic unit.

Water-use data from the well users indicated that most of the overstandard wells were being used for drinking water without treatment—66 percent for arsenic and 93 percent for uranium. This data together with probability and well-distribution data were used to estimate the potential total number of wells in the study area used for drinking water without treatment: approximately 3,800 for arsenic and 3,000 for uranium.

Probability and well-distribution data were also used to determine the sampling effort required to locate 90 percent of the estimated overstandard wells. For arsenic, this could be achieved by sampling wells in those bedrock units with an overstandard probability of 10 percent or greater. This would involve sampling 26 percent of the total number of wells in the study area. For uranium, 90 percent of overstandard wells could be determined by sampling wells in bedrock units with an overstandard probability of 4 percent or greater. This would involve sampling 40 percent of all the wells in the study area.

Increased sampling in the investigation was directed in the regions of three 1:24,000 quadrangles where recent detailed geologic mapping had been conducted. Improved correlations of arsenic and uranium with bedrock unit were measured for two of the three quadrangles compared to the correlations made with the statewide map.

The correlations with bedrock are compatible with a natural bedrock source of the contaminants. By addressing the potential for contamination of bedrock wells in areas of increased contamination probability, well owners and resource managers can better assess risk.

Appendix 1. Abbreviations and Descriptions for Bedrock Units in and Adjacent to the Study Area

Appendix 1. Abbreviations and descriptions for bedrock units in and adjacent to the study area.

[Fm, formation; Mbr, member; bedrock unit abbreviations and descriptions are from Zen and others, 1983]

Bedrock unit abbreviation	Age	Bedrock unit descriptions
Cbw	Cambrian	Braintree Argillite and Weymouth Fm—argillite, with some rare limestone
Cg	Cambrian	Green Lodge Fm of Rhodes and Graves (1931)—quartzite and slate
Ch	Cambrian	Hoppin Fm—quartzite, argillite, and minor limestone
cu	Unknown age	Cumberlandite—rock containing magnetite, ilmenite, olivine, labradorite, and spinel
Dcgr	Devonian	Chelmsford Granite—muscovite-biotite granite
Dchgr	Devonian	Coys Hill Porphyritic Granite Gneiss—microcline granite gneiss
Dchh	Devonian	Coys Hill Porphyritic Granite Gneiss— hornblende gneiss inclusions
Dcygr	Devonian	Cherry Hill Granite—alaskite granite containing ferro-hornblende
Ddi	Devonian	Hardwick Tonalite: Biotite-hornblende diorite and quartz-bearing diorite
Ddn	Devonian	Hardwick Tonalite: Meladiorite and norite
Dfgd	Devonian	Fitchburg Complex—biotite granodiorite to tonalite gneiss
Dfgds	Devonian	Fitchburg Complex—biotite-muscovite granitic gneiss with mica schist and feldspathic granulite inclusions
Dfgr	Devonian	Fitchburg Complex—muscovite-biotite granite
Dfgrg	Devonian	Fitchburg Complex—biotite-muscovite granite to granodiorite gneiss
Dft	Devonian	Fitchburg Complex—biotite-hornblende tonalite inclusions
Dgd	Devonian	Granodiorite
Dgr	Devonian	Biotite-muscovite granite
Dhgr	Devonian	Hardwick Tonalite—porhyritic microcline-biotite granite gneiss
Dht	Devonian	Hardwick Tonalite—biotite tonalite to granodiorite gneiss
Dl	Devonian	Littleton Fm
Dl+Ops	Devonian	Littleton and Partridge Fms, interfolded
Dl+Ops	Devonian	Partridge Fm—interfolded Littleton and Partridge Fms
Dlf	Devonian	Littleton Fm—quartz-feldspar-garnet gneiss, probably felsic metavolcanic rock
Dlm	Devonian	Littleton Fm—calcitic marble
Dlo	Devonian	Littleton Fm—orthopyroxene-biotite gneiss, probably intermediate metavolcanic rock
Dmgr	Devonian	Muscovite-biotite granite
DOgr	Devonian/Ordovician	Alkalic granite in Franklin
Dpgr	Devonian	Peabody Granite—alkalic granite containing ferro-hornblende
Drgr	Devonian	Granite of Rattlesnake Hill pluton—biotite-granite and fin -grained riebeckite granite
Drh	Devonian	Hardwick Tonalite: Biotite-garnet-feldspar gneiss of Ragged Hill
DSdi	Devonian/Silurian	Diorite and tonalite
DSn	Devonian/Silurian	Newbury Volcanic Complex—undivided sedimentray and volcanic rocks
DSna	Devonian/Silurian	Newbury Volcanic Complex—porphyritic andesite, includes tuffaceous mudstone
DSnl	Devonian/Silurian	Newbury Volcanic Complex—basalt, andesite, rhyolite, and tuff
DSnr	Devonian/Silurian	Newbury Volcanic Complex—micrographic rhyolite
DSnu	Devonian/Silurian	Newbury Volcanic Complex—calcareous mudstone, red mudstone, and siliceous siltstone
DSw	Devonian/Silurian	Worcester Fm—carbonaceous slate and phyllite and minor metagraywacke
Dwm	Devonian	Wenham Monzonite—monzonite containing ferro-hornblende
DZl	Devonian	Lynn Volcanic Complex—rhyolite, agglomerate, and tuff
fgr	Unknown age	Fine-grained granite and granite porphyry

Appendix 1. Abbreviations and descriptions for bedrock units in and adjacent to the study area. —Continued

Opvs	Ordovician	Partridge Fm—biotite gneiss, metavolcanic; minor amphibolite and sulfidic schis
OZf	Neoproterozoic	Fish Brook Gneiss—biotite-plagioclase quartz gneiss
OZm	Neoproterozoic	Marlboro Fm—amphibolite, biotite schist and gneiss, minor calc-silicate granofels and felsic granofels
OZma	Neoproterozoic	Massabesic Gneiss Complex—biotite feldspar paragneiss intruded by potassium-feldspar-rich gneiss
OZmg	Neoproterozoic	Marlboro Fm—feldspathic gneiss
OZn	Neoproterozoic	Nashoba Fm—sillimanite schist and gneiss, partly sulfidc, amphibolite, biotite gneiss, cal -silicate gneiss, and marble
OZnb	Neoproterozoic	Nashoba Fm: Boxford Mbr—massive amphibolite, minor biotite gneiss
OZq	Neoproterozoic	Quinebaug Fm—amphibolite, biotite, and hornblende gneiss, felsic gneiss, and calc-silicate gneiss
OZsh	Neoproterozoic	Shawsheen Gneiss—sillimanite gneiss, sulfidic at base; minor amphibolit
OZt	Neoproterozoic	Tatnic Hill Fm—sulfidic sillimanite schist, sillimanite schist and gneiss, biotite gneiss; minor amphibolite, calc-silicate gneiss and marble
OZtf	Neoproterozoic	Tatnic Hill Fm: Fly Pond Mbr—calc-silicate gneiss and marble

Appendix 1. Abbreviations and descriptions for bedrock units in and adjacent to the study area. —Continued

[Fm, formation; Mbr, member; bedrock unit abbreviations and descriptions are from Zen and others, 1983]

Bedrock unit abbreviation	Age	Bedrock unit descriptions
OZty	Neoproterozoic	Tatnic Hill Fm: Yantic Mbr—grey mica schist
Pcm	Pennsylvanian	Coal Mine Brook Fm—carbonaceous slate and garnet phyllite; lens of meta-anthracite; conglomerate and arkose
Pd	Pennsylvanian	Dighton Conglomerate—coarse conglomerate having sandy matrix; minor sandstone
Pgr	Pennsylvanian	Biotite granite, with magnetite-bearing pegmatite
Ph	Pennsylvanian	Harvard Conglomerate—conglomerate and chloritoid-hematite phyllite
Pp	Pennsylvanian	Pondville Conglomerate—quartz conglomerate having abundant sandy matrix; boulder conglomerate; arkose
Pr	Pennsylvanian	Rhode Island Fm—sandstone, graywacke, shale, and conglomerate; minor beds of meta-antracite
Prc	Pennsylvanian	Rhode Island Fm—conglomerate, sandstone, and graywacke
Pw	Pennsylvanian	Wamsutta Fm—red to pink conglomerate, graywacke, sandstone, and shale
Pwv	Pennsylvanian	Wamsutta Fm—rhyolite and mafic volcanic rock
PZb	Unknown age	Bellingham Conglomerate—red and gray metamorphosed conglomerate, sandstone, graywacke, and shale
PzZc	Proterozoic Z to earliest Paleozoic	Cambridge Argillite—gray argillite and minor quartzite; rare sandstone and conglomerate
PzZr	Proterozoic Z to earliest Paleozoic	Roxbury Conglomerate—conglomerate, sandstone, siltstone, argillite, and melaphyre
PzZrb	Proterozoic Z to earliest Paleozoic	Roxbury Conglomerate—melaphyre
q	Unknown age	Massive quartz and silicified roc
qd	Precambrian to Phanerozoic	Quartz diorite
Sacgr	Silurian	Ayer Granite—Clinton facies, porphyritic biotite granite
Sagr	Silurian	Ayer Granite—granite to tonalite
Sb	Silurian	Berwick Fm—metamorphosed calcareous sandstone, silstone, and minor muscovite schist (1 polygon)
Sb	Silurian	Berwick Fm—metamorphosed calcareous sandstone, silstone, and minor muscovite schist
Sbs	Silurian	Berwick Fm—mica schist
Se	Silurian	Eliot Fm—phyllite and calcareous phyllite
Sfs	Silurian	Fitch Fm—sulfidic cal -silicate and minor sulfidic schist
Sfss	Silurian	Fitch Fm—sulfidic mica schis
Sgr	Silurian	Rusty-weathering biotite granite to granodiorite
Sngr	Silurian	Newburyport Complex—porphyritic granite with microcline phenocrysts
So	Silurian	Oakdale Fm—metamorphosed pelitic and calcareous siltsone and muscovite schist
SOad	Silurian	Ayer Granite—Devens-Long Pond facies, porphyritic gneissic biotite granite and granodiorite
SOagr	Silurian	Andover Granite—muscovite-biotite granite
SObgr	Silurian	Blue Hill Granite Porphyry—microperthite-quartz porphyry
SObo	Silurian	Boylston Schist—carbonaceous phyllite and schist, locally sulfidic; quartzite; calc-silicate beds
SOcb	Silurian	Cape Ann Complex: Beverly Syenite
SOcgr	Silurian	Cape Ann Complex—alkalic granite to quartz syenite containing ferro-hornblende
SOcsm	Silurian	Cape Ann Complex: Squam Granite—monzodiorite
SOk	Silurian	Kittery Fm—quartzite, partly calcareous; phyllite, schist

Appendix 1. Abbreviations and descriptions for bedrock units in and adjacent to the study area. —Continued

[Fm, formation; Mbr, member; bedrock unit abbreviations and descriptions are from Zen and others, 1983]

Bedrock unit abbreviation	Age	Bedrock unit descriptions
SOngd	Silurian	Newburyport Complex—tonalite and granodiorite
SOqgr	Silurian	Quincy Granite—alkalic granite containing riebeckite and aegirine
SOrh	Silurian	Reubens Hill Fm—amphibolite, hornblende-chlorite schist, and feldspathic schist; includes metamorphosed diorite
SOvh	Silurian	Vaughn Hills Quartzite—quartzite, phyllite, conglomerate, and chlorite schist
Sp	Silurian	Paxton Fm—biotite granofels, calc-silicate granofels, and sulfidic schist
Spa	Silurian	Paxton Fm—amphibolite
Spbc	Silurian	Paxton Fm—diopside calc-silicate granofels
Spbs	Silurian	Paxton Fm: Bigelow Brook Mbr—biotite granofels, sulfidic schist, and minor cal -silicate granofels
Spqr	Silurian	Paxton Fm—rusty-weathering sulfidic quartzite and sulfidic schi
Spso	Silurian	Paxton Fm: Southbridge Mbr—biotite granofels and calc-silicate granofels
Spsq	Silurian	Paxton Fm—sulfidic magnesian biotite and magnesian cordierite schist and sillimanite quartzite
Spss	Silurian	Paxton Fm—sulfidic mica schis
Ssaqd	Silurian	Straw Hollow Diorite and Assabet Quartz Diorite, undifferentiated—biotite-hornblende diorite and quartz diorite
Ssqd	Silurian	Sharpners Pond Diorite—biotite-hornblende tonalite and diorite
St	Silurian	Tower Hill Quartzite—quartzite and phyllite
Sts	Silurian	Tower Hill Quartzite—gray phyllite
SZtb	Silurian	Tadmuck Brook Schist—andalusite phyllite and sillimanite schist, partly sulfidic; local quartzite
T	Tertiary	Tertiary sediments—unconsolidated sand, silt, and clay in discontinuous patches
TRe	Triassic	Red arkosic conglomerate, sandstone, and siltstone
u	Precambrian to Phanerozoic	Serpentinite
Zagr	Neoproterozoic	Alaskite—mafi -poor gneissic granite, commonly containing muscovite
Zb	Proterozoic Z	Blackstone Group—undivided, quartzite, schist, phyllite, marble, and metavolcanic rocks
Zbq	Proterozoic Z	Blackstone Group: Quinnville Quartzite
Zbs	Proterozoic Z	Blackstone Group—mica schist and phyllite
Zbv	Proterozoic Z	Blackstone Group—greenstone and amphibolite
Zdgr	Proterozoic Z	Dedham Granite—granite; includes dioritic rock
Zdi	Proterozoic Z	Diorite—hornblende diorite metamorhosed in part to amphibolite and hornblende gneiss
Zdigb	Proterozoic Z	Diorite and gabbro—complex of diorite and gabbro, sub. metavolcanic rocks and intrusive granite and granodiorite
Zdngr	Proterozoic Z	Dedham Granite—granite to granodiorite
Zegr	Proterozoic Z	Esmond Granite—biotite granite
Zfgr	Proterozoic Z	Granite of the Fall River pluton—biotite granite, in part mafic poo
Zfm	Proterozoic Z	Felsic and mafic volcanic rock
Zgb	Proterozoic Z	Gabbro—hornblende gabbro and hornblende-pyroxene gabbro metamorphosed in part to hornblende gneiss and amphibolite
Zgg	Proterozoic Z	Granite, gneiss, and schist, undivided—plutonic and metamorphic rocks
Zgmgd	Proterozoic Z	Grant Mills Granodiorite—porphyritic granodiorite

USGS Study on Arsenic and Uranium in Bedrock Wells of East Central Massachusetts

Dear Resident Well User:

The U.S. Geological Survey (USGS) and the Massachusetts Department of Environmental Protection (MDEP) are conducting a study of drinking water to assess the extent of possible elevated concentrations of naturally occurring arsenic and uranium in bedrock aquifers that provide drinking water in east central Massachusetts. The well at your address has been chosen by a random selection process to be included in the study.

The study, conducted by John Colman, U.S. Geological Survey (508 490 5027), will indicate relationships between arsenic and uranium concentrations and type of bedrock in which a well is drilled. This information will help guide future water-supply development, well-water testing, and estimates of total numbers of wells affected.

Your participation is completely voluntary, and results from your well will be kept completely confidential (by Exemption 9, well data is not subject to the Freedom of Information Act) and will only be used for the purpose of this study.

We will report results to you with information about health effects of drinking water greater than standards and ways to decrease concentrations. If you have any questions, please do not hesitate to contact the project leader John Colman at: (508) 490 5027.

Questionnaires will be mailed to a small number of the selected well addresses by the Massachusetts Department of Public Health (MDPH). The MDPH questionnaire offers a second program of biomonitoring for some participants concerned about uranium and arsenic effects on health. Participation in the MDPH program is also voluntary and is not required for well testing by USGS.

In Parts 1 and 3 of the survey we want to know a little about your water and where it comes from. In Part 2, there are instructions about how to collect a water sample. When you are done, please use the enclosed business reply envelope to mail your survey and water samples back to the USGS. **Please mail in the bottles and survey soon, if possible within 2 weeks. If it goes longer, however, we are still interested.**

PART 1 - Water Sources and Supplies

The majority of residential water supply wells in east-central Massachusetts are private wells that tap ground water aquifers in fractured bedrock formations. In the first part of this study, we would like to ask you a few questions about your water source and supply.

1. Is your home supplied with water from a private (bedrock) well?

   ☐ Yes (go to question 2)

   ☐ No. My house supply is town water or another source other than bedrock well.

   Please **STOP** here. You do not have to mail back bottles or a water sample.

Appendix 2. Letter to potential participants in the study.—Continued

2. Is your well water treated?

☐ Yes

What is the treatment? _____

☐ No

3. How many people are in your household? *(This question is to determine the amount of water use in your household).*

_____ People live in this household .

4. Do you use your well water for drinking water and/or cooking?

☐ Yes

☐ No, because of water quality issues (Select all that apply):

☐ **Arsenic** ☐ **Uranium**

☐ **Iron** ☐ **Sediment**

☐ **Manganese** ☐ **Taste**

☐ **Other**_____

Part 2 - Water Sampling Instructions

Although collecting a water sample is a relatively simple task, there are several steps that must be taken to ensure accurate results. Please follow the instructions in steps 1-6 below to complete the next section of the survey.

Sampling Objective

The objective is to get a water sample that represents the water in the bedrock aquifer as closely as possible, so please select a tap that does not have treatment. Both bottles should be filled from the same faucet, one that does not have a water treatment system. Sample bottle screw threads and cap should not be contaminated with dirt from hands or the tap.

Once the bottles are filled, please mail the samples and questionnaire in the enclosed, prepaid business reply envelope.

Appendix 2. Letter to potential participants in the study.—Continued

Instructions

1. Collect your water sample **in the sample containers provided by the USGS**. Samples collected in any other container will not meet lab standards and cannot be processed.
2. **Choose a location to sample your water.** If you **do not** have any water treatment devices, such as a water softener or a reverse osmosis filter, take the sample from a cold water tap where you get your drinking water. If you **do** have treatment devices on your water system, (other than a whole-house filter for sediment) please locate a faucet which is attached to the water line before the treatment system.
3. Please avoid contamination of your samples, and do not touch the inside of the bottle or cap.
4. **Turn on the cold water and let it run for 1 minute** to flush the water out of the pipes. Turn the faucet down to a pencil size stream of water and fill the sample container.
5. Place the bottles and your completed survey in the enclosed postage-paid, business-reply envelope.
6. Mail the envelope to the USGS.

PART 3 - Location and Time of Water Sample

Please tell us where and when you collected the water for this sample.

- ☐ Basement Faucet
- ☐ Outside Spigot
- ☐ Bathroom Faucet
- ☐ Kitchen Faucet
- ☐ Other _____

Date and time of sampling_____

We would like to conduct follow-up sampling with a visit to a small number of participants. Would you be willing to participate in the follow-up visit?

- ☐ Yes, I would like to participate in a follow-up visit.
  Please contact me by phone: _____
  Or by email: _____
- ☐ No, I would not like to participate in a follow-up visit.

We would like to thank you for taking the time to participate in this important study.

PAPERWORK REDUCTION ACT STATEMENT: The Paperwork Reduction Act of 1995 (44 U.S.C. 3501 et. seq.) requires us to inform you that this information is being collected to inform a study on arsenic and uranium in bedrock wells of east central Massachusetts. The estimated burden for this collection of information is estimated to average 20 minutes per response, including the time for reviewing instructions, answering questions, collecting water samples. The response to this request is voluntary. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB Control Number. Comments regarding the burden estimate or any other aspect of this collection of information should be directed to: John Colman at (508) 490 5027.

Appendix 3. Probability of Arsenic Exceeding a Given Concentration by Bedrock Unit

Appendix 3. Probability of arsenic exceeding a given concentration, by bedrock unit.

[Probabilities with bold typeface apply to concentrations at the U.S. Environmental Protection Agency drinking-water standard for public supplies. Multiply probability values by 100 to obtain percent probability; *, fewer than five analyses were above the analytical reporting limit and the option to assume a common scale was used in the distribution fitting]

Arsenic, in micrograms per liter	Grouped bedrock units with elevated arsenic concentration			Bedrock unit abbreviation

Appendix 3. Probability of arsenic exceeding a given concentration, by bedrock unit.—Continued

[Probabilities with bold typeface apply to concentrations at the U.S. Environmental Protection Agency drinking-water standard for public supplies. Multiply probability values by 100 to obtain percent probability; *, fewer than five analyses were above the analytical reporting limit and the option to assume a common scale was used in the distribution fitting]

Appendix 5. Probability of uranium exceeding a given concentration by bedrock unit. —Continued

[Probabilities with bold typeface apply to concentrations at the U.S. Environmental Protection Agency drinking-water standard for public supplies. Multiply probability values by 100 to obtain percent probability; *, fewer than five analyses were above the analytical reporting limit and the option to assume a common scale was used in the distribution fitting]

Appendix 5. Probability of uranium exceeding a given concentration, by bedrock unit.—Continued

[Probabilities with bold typeface apply to concentrations at the U.S. Environmental Protection Agency drinking-water standard for public supplies. Multiply probability values by 100 to obtain percent probability; *, fewer than five analyses were above the analytical reporting limit and the option to assume a common scale was used in the distribution fitting]

Appendix 5. Probability of uranium exceeding a given concentration, by bedrock unit.—Continued

[Probabilities with bold typeface apply to concentrations at the U.S. Environmental Protection Agency drinking-water standard for public supplies. Multiply probability values by 100 to obtain percent probability; *, fewer than five analyses were above the analytical reporting limit and the option to assume a common scale was used in the distribution fitting]

Appendix 5. Probability of uranium exceeding a given concentration, by bedrock unit.—Continued

[Probabilities with bold typeface apply to concentrations at the U.S. Environmental Protection Agency drinking-water standard for public supplies. Multiply probability values by 100 to obtain percent probability; *, fewer than five analyses were above the analytical reporting limit and the option to assume a common scale was used in the distribution fitting]

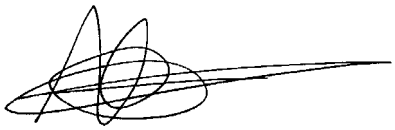
***ECMS* Project No. 1289.001**

Dear Mayor Gove:



This letter has been prepared by *Environmental & Construction Management Services, Inc. (ECMS)* on behalf of Charles C. Cashman Elementary School pursuant to the requirements of the Massachusetts Contingency Plan (MCP), 310 CMR 40.0000, Section 40.1403 Minimum Public Involvement Activities in Response Actions.

The purpose of this letter is to inform you that Release Notification that was provided to the Commonwealth of Massachusetts Department of Environmental Protection (MassDEP) associated with the detection of arsenic in the soils at the Charles C. Cashman Elementary School has been retracted. The arsenic was determined to be naturally occurring and is therefore outside the scope of the MCP. The MassDEP concurs with the natural origin of the material and requested that a retraction be filed for the site.

Should you have any questions or require additional information or a copy of the entire report documents, please contact the MassDEP, Northeast Regional Office (NERO), Bureau of Waste Site Cleanup in Wilmington, Massachusetts at (978) 694-3220 or obtained if available via MassDEP at http://public.dep.state.ma.us/wsc_viewer.

Sincerely,

*For **Environmental & Construction Management Services, Inc.** by*

SECTION 024100

DEMOLITION

PART 1 GENERAL

1.01 GENERAL REQUIREMENTS

A. PART A and DIVISION 1 of PART B are hereby made a part of this SECTION.

B. The Contract Drawings indicate the general extent of the removals and alteration work required to be performed. The Contractor will be held fully responsible for removing all existing materials which would otherwise interfere with the proper installation or function of new work, whether or not such existing materials or conditions have been indicated, such work being performed without additional cost to the Contract, and performing the demolition and removals, work, except where specifically noted to the contrary in the various trade SECTIONS of the Specifications, in which cases the specific trades shall include all costs therefore in their respective bids.

1.02 BACKGROUND INFORMATION AND JOB CONDITIONS

A. The Work detailed in this Section and related Sections involve demolition of the following:

1. Demolition includes disconnection of existing utilities, and removal of all associated materials, equipment and other structures.
2. Existing Little League concession stand, deck, and site amenities.
    a. The existing one-story concession building was constructed in the mid-1990's and consists of concrete slab-on-grade, wood frame walls and roof structure. It is clad in vinyl clapboards and has an asphalt shingle roof and wood deck.
    b. Site amenities to be demolished include, but are not limited to, baseball dugout, backstop and batting cage structures.
3. Selective demolition of the existing retaining wall at the Cashman Elementary School

B. Salvaged items include the storage shed adjacent to the concession building, field lighting, scoreboards and dugout lockers.

C. Asbestos, Lead Paint and PCBs: An environmental report for areas of demolition was prepared (see Attachment A).

1.03 SCOPE OF WORK

A. Perform the following items of work as shown on the Drawings and specified herein:

1. Furnish, install and maintain in safe condition at all times, temporary protection items required to ensure safety for persons and property during the demolition and removal work.

2. Furnish, install, and maintain dust coverings as required to prevent the spread of dust beyond the immediate area where interior demolition and removal work is being performed.

3. Arrange with the appropriate municipal authorities for street cutoffs of services which may be required in conjunction with the demolition and removal work and pay any and all costs incurred therefrom.

4. After all affected services have been disconnected thereto, or otherwise made inactive, remove all abandoned building contents, perform the demolition work and major cutting, remove all demolished and abandoned materials from the site, and legally dispose of same. Haul and dispose of material generated from the demolition including all demolition debris, in accordance with all local, state and Federal regulations.

1.04 QUALITY ASSURANCE

A. Codes, Permits, and Regulations

1. The Contractor shall comply with all applicable laws, rules, ordinances, and the general regulations of the Federal Government, the Commonwealth of Massachusetts, city of Amesbury and Massachusetts Department of Environmental Protection (DEP) for removing and disposing of all demolition materials.

2. The Contractor shall obtain all permits required to conduct the work. The permit fees require by Amesbury will be waived.

B. The Contractor shall protect adjacent structures to remain and leave the same in a safe and satisfactory condition.

C. Approvals given by the Architect shall not relieve the Contractor of the responsibility for performing the work in accordance with the Contract Documents.

D. Any change from requirements of these documents or from procedures outlined in Contractor's demolition plan shall be requested in writing. No changes will be allowed unless approved by the Architect.

1.05 RELATED WORK SPECIFIED ELSEWHERE

A. The following related work is to be performed under the designated SECTIONS:

1. Removal of certain items, drilling, coring and specified cutting and surface preparation: As specified in various SECTIONS.
2. Administrative and procedural requirements for recycling and disposing demolition waste: SECTION 017419-CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
3. Removal of shrubs, trees, clearing and grubbing. Removal of pavement and other items of site demolition: SECTION 311000-SITE PREPARATION.
4. Excavation, backfill, filling, and establishing new subgrades where applicable: SECTION 312000-EARTHWORK.

1.06 SUBMITTALS

A. Submit the following information and other requirements of SECTION 013300 – SUBMITTALS.

1. A demolition plan describing the proposed sequence, methods, schedule and equipment for all demolition work shall be submitted a minimum of 3 days prior to beginning work at the next site. Include a narrative description of the following:
   a. Procedures and sequence of operations for cleaning and dismantling structures including equipment inside the building.
   b. Locations for disposal of demolition materials.
2. Copies of all related permits and notices authorizing demolition.
3. Certificates of utility severances.
4. Permits for transport and disposal of demolition debris and other waste materials generated.
5. Certification that all demolition debris has been rendered non-hazardous prior to removal from the site.

1.07 HAZARDOUS MATERIALS REGULATIONS

A. The Contractor shall remove all hazardous materials in full compliance with all applicable Federal, State, and local regulations as they apply to potentially hazardous materials for the protection of workers and the environment.

PART 2 PRODUCTS (not used)

PART 3 EXECUTION

3.01 GENERAL

A. The Demolition Subcontractor shall be responsible for any materials analysis required, such as containerized liquids or other materials, required to adequately characterize the material for disposal.

B. All hazardous waste removal shall be performed by a qualified, hazardous waste Contractor licensed to handle, transport and dispose of each type of hazardous material.

C. Conduct operations with a minimum of interference to public or private accesses and facilities. Maintain access and egress at all times and clean and sweep any roadways daily or as required by the governing authority. At such times as deemed necessary by the Owner, dust control shall be provided with sprinkling systems or equipment provided by the Contractor.

D. Promptly notify the Architect when any unexpected items are encountered during demolition.

E. The Contractor shall ensure that demolition debris is treated in a controlled manner such that the potential of cross-contamination between material that exhibits visual or olfactory evidence of contamination and clean material is eliminated.

3.02 DESCRIPTION OF WORK

A. Obtain and pay for all permits and licenses required to perform demolition work, prior to commencing the work of this SECTION.

B. Conditions, as they are known to bid date, have been indicated on the Drawings; however, all existing dimensions shall be verified on site before commencing work.

C. The Site Utilities, Plumbing, Heating, Ventilating, Air Conditioning and Electrical Subcontractors respectively, shall perform the disconnecting and capping where necessary, of existing mechanical and electrical items which are to be removed and/or relocated.

D. The Demolition Subcontractor shall perform the cutting and removal of all items so designated on the Drawings except as otherwise specified hereunder. Where items are designated to be relocated, the Demolition Subcontractor shall perform the relocation of all items, which are not normally installed by a Sub-Trade. Where such equipment is to be installed by a Sub-Trade, the applicable Subcontractor shall be responsible for disconnecting and moving such items to the room or area where these items are to be relocated. The respective subcontractor shall be responsible for storing such items if the areas for relocation are under the Owner's Use and Occupancy at the time of disconnect.

E. Installation of all relocated equipment of the Sub-Trades, including required alterations thereto, shall be performed by the respective Subcontractors under whose jurisdiction this work is normally performed.

F. Prior to commencing cutting work in existing floors and walls, the Contractor shall take all precautionary measures to assure that mechanical and electrical services to the particular area of work are turned off, as far as practicable.

G. Use no explosives or fire in the performance of the demolition and removals work.

H. Perform all cutting in existing surfaces in manner which will ensure a minimal difference between the cut area and new material when patched.

I. If, in the process of cutting work, existing utility lines or fixtures are encountered which have not been indicated on the Drawings, and whether or not such items are damaged, report such items to the Architect immediately, requesting disposition of same. Do not proceed with the work in such areas until such disposition has been obtained. Should the Contractor be directed, in writing by the Architect, to repair, remove, and/or relocate such items, the work shall be performed with the Contract Price adjusted accordingly.

3.03 DEMOLITION

A. Perform demolition using equipment of a type and size acceptable to the Engineer. Wrecking balls, whip hammers or similar devices will not be acceptable.

B. Do not bring explosives to the site and do not use any explosives in performance of the work.

C. Conduct demolition to preclude damage and minimize interference with other existing structures and utilities to remain at the project site.

D. Perform demolition in accordance with the submitted and accepted demolition plan.

E. Dismantle and remove for off-site disposal the existing building equipment, piping, transformers, and other ancillary structures. Utilize appropriate equipment in sufficient quantity and sizes to expeditiously perform the demolition.

3.04 DUST AND POLLUTION CONTROL

A. Use water sprinkling, temporary enclosures and other suitable methods to limit to the lowest practical level the amount of dust and dirt rising into the air.

B. Comply with applicable regulations pertains to environmental protection and pollution.

C. Clean existing structures of dust, dirt and debris caused by demolition operations as directed. Return adjacent areas to condition existing prior to the start of the work.

3.05 CONTAMINATION AND HAZARDOUS WASTE

A. The Demolition Subcontractor is responsible for removal and disposal of all materials encountered during conduct of work.

B. Collect and containerize rinseate generated for cleaning of machinery, equipment and demolition debris and dispose of in a legal manner.

C. Provide copies of manifests for disposal of all drummed wastes to the Architect.

3.06 DISPOSITION OF REMOVED MATERIALS

A. Except for items specifically designated to be relocated and/or re-used, or salvaged by Owner, or removed and disposed of under another Section, all existing removed building materials and items and abandoned building contents shall become the property of the Demolition Subcontractor and shall be completely removed from the site and legally disposed of beyond town limits.

1. All materials including, but not limited to, equipment, machinery and maintenance supplies removed from the building shall be transported to a salvage facility immediately. No stockpiling will be allowed.

2. Contractor shall clean, disassemble, remove, transport, and dispose of all materials including, but not limited to, indicated equipment, machinery and maintenance supplies. Contractor shall remove free liquids from the interior of each piece of equipment and handle them in accordance with the requirements of this SECTION.

B. Owner Salvage: Items to be delivered by the Contractor to the Owner's storage site after removal under the Contract shall include:

1. Storage shed adjacent to Concession Building

2. From Concession Building: Kitchen Equipment: Grill, hood, stainless steel sinks (including faucets) and wall mounted safe.

3. Site Amenities:

   a. Sport lighting including poles

   b. Scoreboards (not including steel supports and concrete footings)

   c. Dugout lockers

C. Items to be removed by the Owner prior to the Demolition Subcontractor's on-site operations:

1. From Concession Building:

   a. Refrigerator and freezers

   b. Picnic tables

   c. Sports equipment

2. From Shed:

   a. Infield grooming tractor and supplies

   b. Line marking equipment and supplies

   c. Sports equipment

3.07 SCHEDULING OF DEMOLITION WORK

A. The existing Cashman Elementary School adjacent to the site will be operational. Demolition work may not proceed until all site fencing and signage are in place to ensure the safety of Cashman School occupants and visitors.

B. Work at the Cashman Elementary School shall be coordinated with school operations.

END OF SECTION

Division 3
Concrete

SECTION 033000

CAST-IN-PLACE CONCRETE

PART 1 GENERAL

1.01 GENERAL REQUIREMENTS

A. PART A and DIVISION 1 of PART B are hereby made a part of this SECTION.

B. Examine all conditions as they exist at the project prior to submitting a bid for the work of this SECTION.

C. Coordinate work with that of all other trades affecting or affected by work of this Section. Coordinate with such trades to assure the steady progress of all work under the Contract.

1.02 SCOPE OF WORK

A. The work of this Section consists of all plain and reinforced concrete work as shown on the Drawings and as specified herein, and includes, but is not limited to the following:

1. Furnishing, placing, curing, and finishing of all plain and reinforced concrete work for the building and site.
2. Furnishing, erection and removal of formwork and shoring.
3. Furnishing and placing of reinforcing steel and related accessories.
4. Furnishing and installation of vapor retarder.
5. Furnishing and installation of underslab insulation.
6. Furnishing and installation of bentonite strip waterstops.
7. Furnishing and installation of mastic coating on embedded structural steel.
8. Furnishing and installation of joint fillers.
9. Setting of anchor rods and grouting of leveling plates and bearing plates.
10. Coordination with all other trades for location of all pipe sleeves, roof drains, floor drains, duct openings, keys, chases, electrical boxes and conduits, anchors, inserts, fastenings, and other devices required by other trades.
11. Grouting anchor rod oversize holes at column base plates.
12. Hardening and sealing of exposed concrete floors.
13. Coordination of floor slab finish requirements with flooring manufacturers and contractors.

14. As-built surveys of concrete floor slab elevations.

15. Furnishing and installation of leveling of concrete slabs with a self-leveling concrete underlayment if required to meet the specified tolerances.

B. Items to be installed only: Install the following items furnished by the designated Sections:

1. Section 051200 - STRUCTURAL STEEL FRAMING: Anchor bolts, embedded plates with bolts or anchors, as indicated by the Drawings.

C. LEED v4-S Requirements:

1. The work of this section includes material and submittal requirements for fulfillment of Project LEED v4-S Certification. LEED v4-S Certification at "Silver" Level is an Owner Requirement that is critical to secure project funding from the Massachusetts School Building Authority. LEED v4-S requirements for the work of this Section are detailed herein, and additionally in DIVISION 1 of this Project Manual.

2. For all adhesives and sealants field applied on site and inside the weatherproofing, meet the LEED v4-S requirements for IEQ Credit 2, Low Emitting Materials as defined in SECTION 018113 - SUSTAINABLE DESIGN REQUIREMENTS.

3. For all adhesives and sealants field applied on site and inside the weatherproofing, submit industry-wide (generic) EPDs or product specific Type III EPDs.

4. For all paints and coatings, meet the LEED requirements for IEQ Credit 4.2 and as defined in Subparagraph 2.04 of Section 018113 - SUSTAINABLE DESIGN REQUIREMENTS.

5. For all paints and coatings, submit industry-wide (generic) EPDs or product specific Type III EPDs

6. For all concrete, meet the LEED requirements for MR Credit 4: Recycled Content.

7. For all concrete, meet the LEED requirements for MR Credit 5: Regional Materials.

8. For all concrete, submit industry-wide (generic) EPDs or product specific Type III EPDs.

1.03 RELATED WORK SPECIFIED ELSEWHERE

A. The related work shall be performed under the following Sections:

1. Section 040001 MASONRY.

2. Section 050001 MISCELLANEOUS AND ORNAMENTAL IRON.

3. Section 051200 STRUCTURAL STEEL FRAMING.

4. Section 051226 SHEAR CONNECTORS

5. Section 053100 STEEL DECKING
6. Section 055000 MISCELLANEOUS METALS.
7. Section 070001 WATERPROOFING, DAMPROOFING AND CAULKING.
8. Section 072100 INSULATION.
9. Section 312000 EARTHWORK.
10. Section 321313 SITE CONCRETE.

1.04 REFERENCES (LATEST EDITIONS)

A. ASTM listed standards by the American Society for Testing and Materials.

B. ACI listed standards by the American Concrete Institute.

C. CRSI listed standards by the Concrete Reinforcing Steel Institute.

D. In case of conflict between the References and the Project Specification, the Project Specification shall govern. In the case of conflict between References, the more stringent shall govern.

E. When compliance with any such References is specified herein for materials or a manufactured or fabricated product, the Contractor, if requested, shall furnish an affidavit from the manufacturer or fabricator certifying that the materials or product delivered to the job meets the requirements specified. However, such certification shall not relieve the Contractor from the responsibility of complying with any added requirements specified herein.

1.05 SUBMITTALS

A. Submit Complete Shop Drawings and Data, in accordance with the provisions of SECTION 013300 - SUBMITTALS.

1. Shop Drawings:

a. Construction joint layout: Submit drawings showing proposed construction joint locations for all walls and slabs. Drawings shall be submitted prior to preparation of reinforcement drawings.

b. Reinforcement Drawings: Prepare in accordance with ACI 315, "Manual of Standard Practice for Detailing Reinforced Concrete Structure" and show the following: elevations; dimensions of concrete work with specified reinforcement clearances; ledges, brackets, openings, sleeves or other items furnished by other Sections, where interference with reinforcement may occur; bending diagrams; assembly diagrams; splices and laps of reinforcement; temperature and shrinkage reinforcement; construction joint locations and reinforcement; shapes, dimensions, grade designations and details of reinforcement and

accessories. Show dowels with concrete work to be placed first. Indicate suitable marks for placing bars.

c. Formwork Drawings: Schedules of placement; beam and haunch detailing, expansion joint details, construction joints and contraction or control joints with methods of forming; general arrangement, sizes and grades of lumber, panel and tie layouts and alignment. Formwork drawings will be reviewed for general compliance with the Contract Documents only. Dimensions, strength of formwork, shoring, bracing, and all related work are the sole responsibility of the Contractor. At Architecturally Exposed Concrete areas, show layout of joint patterns and exposed cone recesses at wall ties.

d. Except as otherwise noted, approval of Shop Drawings will be for size and arrangement of components. Errors in dimensions shown on Shop Drawings shall be responsibility of the Contractor.

e. Check and coordinate cast-in-place concrete work with work of other trades before submitting Shop Drawings.

f. Submit plans for all levels with M.E.P. penetration sizes and locations for approval prior to submitting reinforcing shop drawings.

g. Reproduction of structural plans, sections and details, and any like information by reprographic or electronic methods for use as Shop and Coordination Drawings is subject to the following conditions:

1) The entity producing the Shop and Coordination Drawings (The “User”) agrees to accept the reproduced information from Foley Buhl Roberts & Associates, Inc. without any warranties, guarantees and/or representations of any nature whatsoever regarding the correctness, dimensional and/or quantitative accuracy and/or completeness of any such information contained therein.

2) The User further agrees that such information shall be used as reference material only for the production of Shop and Coordination Drawings for the referenced project to which this Specification applies and only for that project.

3) The User further agrees to release, indemnify, hold harmless and defend Foley Buhl Roberts & Associates, Inc. with respect to any claims, costs (including the cost of litigation), losses, damages and/or liabilities which arise from (or related to) the use, misuse, modification, interpretation, misinterpretation and/or misrepresentation of the reproduced information.

2. Concrete Constituents: Submit a detailed list of concrete materials and corresponding sources, proposed for use in concrete for this project. If conveying concrete by pump is requested by the Contractor, related data regarding concrete materials, pumping devices and methods shall be submitted to Architect for approval three weeks before such method is proposed for use. Provide concrete mix data as specified in Paragraph 2.02B.

3. Methods of Construction: Prior to starting work, submit summary of methods, sequence of construction, and type of equipment proposed for use for performing cast-in-place concrete work. This submission shall not relieve the Contractor of his responsibility for providing proper methods, equipment, workmanship and safety precautions.

4. Samples: Submit samples and/or descriptive literature of materials, products, and methods as noted herein, and as otherwise requested by the Architect: concrete constituents including admixtures; form ties and spreaders; accessories for reinforcement; reglets; non-shrink cement grout; inserts; form release agents and waterstops.

5. Mill Test Certification: Prior to delivery of steel or concrete to job site, submit certified mill test reports of reinforcing steel and cement, (including names and locations of mills and shops and analyses of chemical and physical properties) properly correlated to concrete to be used in this project. Test reports for reinforcing to be welded shall show that the steel meets AWS weldability requirements.

6. Concrete Curing and Protection: Submit summary of methods proposed for curing and protection of concrete. When applicable, submittal shall include methods of cold weather protection following the requirements of ACI 306 – Cold Weather Concreting and/or hot weather protection following the requirements of ACI 305 – Hot Weather Concreting.

7. Corrective Work: Submit drawings showing details of any proposed corrective work.

8. Affidavit: Submit, upon request by Architect, manufacturer's and/or supplier's and/or installer's affidavit stating that material or product provided complies with the Contract Documents.

B. Provide concrete Mix Data as specified in Paragraph 2.02B.

C. Provide manufacturer's data for other products.

D. Fabrication of any material or performing of any work prior to the final approval of the Submittals will be entirely at the risk of the Contractor.

E. The Contractor is responsible for furnishing and installing materials called for in the Contract Documents, even though these materials may have been omitted from approved Submittals.

F. LEED v4-S SUBMITTAL REQUIREMENTS:

1. Submit relevant supporting documentation as required by LEED for schools v4 and as detailed in SECTION 018113 - SUSTAINABLE DESIGN REQUIREMENTS.
2. Submit a completed LEED MATERIAL REPORTING FORM, per SECTION 018113 - SUSTAINABLE DESIGN REQUIREMENTS.
3. Product substitution requests are subject to additional LEEDv4-S submittal requirements, see SECTION 012500 - SUBSTITUTION PROCEDURES.

1.06 QUALITY ASSURANCE

A. All materials, measuring, mixing, transportation, placing and curing shall be subject to inspection by the Architect or by the Testing Agency. However, such inspection, wherever conducted, shall not relieve the Contractor of his responsibility to furnish materials and workmanship in accordance with the Contract requirements, nor shall inspector's acceptance of material or workmanship prevent later rejection of same by the Owner or Architect if defects are discovered.

B. A qualified Testing Agency for testing and inspection will be selected by the Owner and will be paid directly by the Owner.

C. The Contractor shall retain the services of a qualified testing agency, approved by the Architect, to test aggregate and to prepare or review mix designs for each strength of concrete specified, and shall submit mix designs and test results to the Architect for approval. The costs of all such preliminary services shall be borne by the Contractor.

D. Advise the Testing Agency of intent to place concrete by notification at least 24 hours prior to the time of placement.

E. Concrete will be sampled and tested for quality control as follows:

1. ASTM C 172: Sampling fresh concrete.
2. ASTM C 31: Compression test specimens.
3. ASTM C 143: Slump.
4. ASTM C 231: Air content.
5. ASTM C 39: Compressive strength.
6. ASTM C 618: Standard Specification for Fly Ash and Raw or Calcined Natural Pozzolan for Use as a Mineral Admixture in Portland Cement Concrete.

7. ASTM C 311: Standard Methods of Sampling and Testing Fly Ash and Natural Pozzolans for Use as a Mineral Admixture in Portland Cement Concrete.

F. Concrete floor slabs shall be prepared in accordance with ASTM F 710: Standard Practice for Preparing Concrete Floors to Receive Resilient Flooring.

G. All reinforcing will be inspected by the Testing Agency for grade, size, spacing, position, cleanliness, cover, and support.

H. Cooperate with the Testing Agency's work and provide help as required for taking and storing samples. Provide storage facilities for concrete cylinders at the site. Facilities must protect cylinders from affects of low or high temperatures in cold or hot weather, respectively.

I. Compression tests shall consist of four - six inch diameter by twelve inch long cylinders (or six - four inch diameter by eight inch long cylinders) for each test made, cured and tested by the laboratory during the progress of the job. At least one test shall be made for each strength of concrete up to 50 cubic yards pour, and at least one test per strength for each 50 cubic yards thereafter, unless otherwise directed by the Architect. For each test made, one cylinder shall be tested at seven-days test sample age and two - six inch diameter cylinders (three - four inch diameter cylinders) shall be tested at 28-day test sample age. One six inch diameter cylinder (or two – four inch diameter cylinders) for each test shall be kept in the event that a 56-day sample age test is required due to low 28-day results. Concrete for each set of cylinders shall be from one sample representative of the entire batch.

J. In addition to the above, the Architect or the Contractor may direct additional control cylinders to be made, cured and tested to verify strengths for removal of forms, shoring or adequacy for curing or cold weather protection. In such instances, the cylinders shall be cured in the same environment as the area which the cylinders represent. All such additional work requested by the Contractor shall be at his own expense.

K. Evaluation of Compression Tests:

1. Architect has authority to order, for any strength of concrete, increase in cement content and mix redesign for remaining work of either:

   a. Average seven-day strength of any two consecutive tests representing a particular design strength of a class of concrete is less than 55 percent of specified strength; OR

   b. Average 28-day strength of any two consecutive tests representing particular design strength of a class of concrete is less than 90 percent of specified strength.

2. The strength level of a class of concrete shall be considered satisfactory, if the following requirements are met:

a. Averages of any three consecutive 28-day strength tests representing each class of concrete equal or exceed the specified strength (f'c).

b. Not more than 10 percent of 28-day strength tests have values less than the specified strength (f'c).

c. No individual 28-day test shows an average strength less than 90 percent of specified strength (f'c).

3. When tests of control specimens fall below the strength level requirements, the Architect may require core specimens taken from concrete in question and tested in accordance with ASTM C 42. If these specimens do not meet the strength requirements, the Architect will have the right to require additional curing, load tests, strengthening or removal and replacement of those parts of the structure which are unacceptable, and in addition, removal of such sound portions of structure as necessary to ensure safety, appearance and durability of the structure. Additional testing, load tests, strengthening or removal and replacement of parts of the structure and any costs associated with redesign or delay of the project shall be at the Contractor's expense.

L. Upon completion of concrete testing for the project the Testing Agency will compile all results and perform a statistical strength analysis for each class of concrete in accordance with ACI 214.

M. Accept as final, results of tests made by the qualified professional testing organization engaged by the Owner.

N. Testing required because of changes requested by the Contractor in materials, sources of materials or mix proportions, and extra testing of concrete or materials because of failure to meet the Specification requirements is to be paid by the Contractor.

O. A final report will be issued by the Testing Agency following the completion of work in this Section stating that all deficiencies have been corrected.

P. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1.

1. Before submitting design mixtures, review concrete design mixture and examine procedures for ensuring quality of concrete materials. Require representatives of each entity directly concerned with cast-in-place concrete to attend, including the following: (1) Architect, (2) General Contractor, (3) Concrete Subcontractor, (4) Independent testing agency, (5) Ready-mix concrete manufacturer, (6) Under slab vapor barrier, waterproofing and damproofing subcontractor and manufacturer’s representative.

2. Review items such as: special inspection, testing and inspection agency procedures for field quality control, concrete finishes and finishing, cold- and hot- weather concreting procedures, curing procedures, construction, contraction and isolation joints, joint filler strips, semi-rigid joint fillers, forms and form removal limitations, vapor-retarder installation, anchor rod and anchorage device installation tolerances, steel reinforcement installation, floor and slab flatness and levelness measurement, concrete repair procedures, and concrete protection.

3. Before concrete slabs on grade are placed, and after approval of all resilient flooring materials, a pre-flooring conference shall be held at the job site. In attendance shall be (1) Architect, (2) General Contractor, (3) Concrete Subcontractor, (4) Resilient Flooring Subcontractor, and (5) Flooring manufacturer's technical representative. The parties shall review drawings, specifications and approved materials and coordinate surface, methods of curing, protection, moisture and PH requirements of the concrete in preparation for the application of the finish flooring materials.

1.07 NOTIFICATION OF RELATED TRADES

A. Notify all other trades responsible for installing chases, inserts, sleeves, anchors, louvers and similar items when ready for such installation, and for final checking immediately before concrete is placed. Cooperate with such trades to obtain proper installation.

B. Leave openings in walls for pipes, ducts, and similar openings for mechanical/electrical/plumbing work, as shown on Drawings or required by layout of mechanical/electrical/plumbing systems.

1.08 SUBSTITUTIONS

A. Refer to Section 012500 - SUBSTITUTION PROCEDURES

PART 2 PRODUCTS

2.01 LEED v4-S REQUIREMENTS

A. Products and materials used for this section of the work are required to meet the following criteria for LEED-v4S materials Credits, and a completed LEED v4 Materials Reporting Form shall be submitted for all materials in this SECTION:

1. Recycled Content. (See Section 018113 Sustainable Design Requirements for overall project recycled content requirements.) The General Contractor shall examine each product or material specification below for a stated minimum recycled content requirement, and if none is stated, the requirements under 018113 shall govern.
2. Regional Content. (See Section 018113 Sustainable Design Requirements for overall project regional content requirements.) The General Contractor shall examine each product or material specification below for a stated minimum regional content requirement, and if none is stated, the requirements under 018113 shall govern.
3. Furnish any adhesives, sealants, paints and coatings such that they meet the requirements for IEQ Credit 2, Low-Emitting Materials as defined in SECTION 018113 - SUSTAINABLE DESIGN REQUIREMENTS.

2.02 MATERIALS

A. Cement:

1. Portland Cement - ASTM C 150, Type I or II.
2. Fly Ash - ASTM C 618 Class F.
3. Ground Granulated Blast-Furnace Slag - ASTM C 989 - Grade 100 or 120.

B. Natural Aggregate:

1. Coarse Aggregate: Shall be hard, durable, uncoated crushed stone or gravel conforming to ASTM C 33. Typical coarse aggregate shall pass through a 3/4" sieve and meet the grading requirements of ASTM C 33 size number 67. Coarse aggregate for toppings less than three inch thick or areas with congested, closely spaced rebar shall pass through a 3/8" sieve and meet the grading requirements of ASTM C 33 size number 8. Coarse aggregate shall meet the following additional requirements:

Fineness Modulus:	(+/- 0.20) 6.70 and 5.5 respectively
Organic:	Plate 1 maximum.
Silt:	1.0 % maximum
Soundness:	5%-8% maximum loss, magnesium sulfate, five cycles.

2. Fine Aggregate: Shall be sand, clean, hard, durable, uncoated grains, free from silt, loam and clay, to meet ASTM C 33. Fine aggregate shall meet the following additional requirements:

Sieve	Retained Percent
#4	0-5
#16	25-40
#50	70-87
#100	93-97

Fineness Modulus:	2.8 (+/- 0.20)
Organic:	Plate 2 maximum
Silt:	2.0% maximum
Soundness:	5%-10% max. loss, magnesium sulfate, five cycles.

C. Water:

1. Water shall be from the local municipal supply.

D. Admixtures:

1. Water-reducing Agent shall conform to ASTM C 494, Type A. Water-reducing agent shall be compatible with air-entraining agent.
2. Superplasticizer shall conform to ASTM C494, Type F or Type G. Superplastizer shall be compatible with the other admixtures.
3. Air-entraining Agent shall conform to ASTM C 260.
4. Calcium Chloride or admixtures containing more than 0.1% Chloride ions are not permitted.

E. Concrete Reinforcement:

1. Reinforcing steel shall conform to ASTM A 615 deformed bars, Grade 60. Reinforcing to be welded shall conform to ASTM A 706 deformed bars, Grade 60
2. Welded wire fabric shall conform to ASTM A 1065 in flat sheets.
3. Reinforcing supports, metal accessories and other devices necessary for proper assembly of concrete reinforcing shall be of standardized factory-made wire bar supports. Reinforcing that bears on vapor barriers shall have integral bearing plates. Wire for tying shall be ASTM A 82, 18 gauge black annealed wire. All accessories shall conform to Product Standard PS7-766, National Bureau of Standards, Department of Commerce, Class C.
4. Steel reinforcing shall be manufactured using minimum 95% recycled materials.

5. Accessories touching formed surfaces exposed to view shall have not less than 1/4 inch of high density polyethylene between metal and concrete surface. Plastic tips shall extend not less than 1/2 inch up on metal legs.

F. Formwork:

1. Forms for concrete surfaces not exposed to view in finished work shall be made of wood, metal, or other material subject to approval of Architect.

2. Form release agent shall be of a non-staining type, specifically manufactured for concrete forms.

3. Form Ties shall be factory-fabricated, removable or snap back of approved design. Wire shall be at least one and one half inch back from exterior surfaces and one inch from interior surfaces. Furnish with removable wooden or plastic cones of approved sizes where called for, with waterproofed stop at exposed concrete surfaces.

4. Chamfer strips shall be one half inch, 45 degree wood strips, or as detailed, nailed six inches on center, and installed at inside corners of all forms, unless otherwise directed by the Architect.

5. Reglets shall be formed from 24 gauge galvanized steel and shall be of type shown on Drawings or appropriate for use intended. Metal reglets shall be used merely as form to obtain desired profile. After concrete has set, remove reglets.

6. Forms for concrete surfaces exposed to view in the finished work (Architecturally Exposed Concrete), shall be new Class 1 B-B High Density Overlay plyform, exterior grade not less than 5 ply nor less than 5/8" thick, conforming to U.S. Product Standard P-1-66.

G. Bonding Agent:

1. Bonding agent for bonding new concrete to existing concrete at construction joints shall be Sikadur 32, Hi-Mod by Sika Corporation; Duracrete by Euclid Chemical Co.; Deck-O-Weld by W.R. Meadows or equal approved by the Architect.

H. Self-Leveling Concrete Underlayment:

1. <u>For areas to be covered by a finish or flooring:</u>
Concrete underlayment used for floor leveling shall be "Sika Level-315" by Sika Corporation, "Ardex K-15" by Ardex, Inc., "ProSpec Level Set 300" by Bonsal American Inc. or equal approved by the Architect.

2. <u>For areas to remain exposed:</u>
Concrete underlayment used for floor leveling shall be "Sika Level-315" by Sika Corporation, "Ardex SD-T" by Ardex, Inc., "ProSpec Level Set Wear Topping" by Bonsal American Inc. or equal approved by the Architect.

3. Aggregate shall be well-graded, washed fine gravel (1/8 inch to 1/4 inch or larger) for use when underlayment is installed to a thickness where aggregate is recommended by the manufacturer.

4. Gypsum based underlayment products are not allowed.

I. Surface Conditioners:

1. Floor hardener for exposed concrete floors shall be “UltraSil LI+ by Euclid Chemical Company, Inc., “L&M Lion Hard” by Laticrete International, Inc., “Liqui-Hard Ultra” by W.R. Meadows, or equal approved by the Architect.

2. Unless otherwise specified, floor hardener is required at all exposed concrete floors.

J. Other Materials:

1. Joint filler where used with caulking or sealants, shall be cork type, non-extruding, self-expanding filler strips conforming to ASTM D 1752, Type III with removable top snap-caps to allow room for sealants or caulking. Where no sealant or caulking is required, strips shall be closed cell flexible polyethylene type conforming to ASTM D 4819, Type II. Joint fillers for exterior paving shall be non-extruding bituminous type in accordance with ASTM D1751 with removable top snap-caps to allow room for sealants. Joint filler manufacturers include W.R. Meadows, or an approved equal.

2. Underslab Vapor Retarder: 15-mil thick polyethylene vapor retarder meeting or exceeding the performance requirements for ASTM E 1745, Class A. Acceptable products include: Stego Industries, LLC, Stego Wrap 15-mil Class A; W.R. Meadows, Perinator 15-mil Underslab Vapor Mat and Reef Industries, Griffolyn 15-mil Green.

3. Curing cover sheets shall be “Hydracure” by PNA Construction Technologies, “Transguard 4000” by Reed Industries, “UltraCure DOT” by McTech Group, or an equal approved by the Architect.

4. Waterstops shall be bentonite strip type Waterstop – RX, manufactured by Cetco; Swellstop by Sika Corporation; Rockmax Swelling 101 by Rockmax Co. Ltd., or an equal as approved by the Architect.

5. Non-Shrink Grout: Grout at column and beam bearing shall be “Masterflow 100” by BASF, “Sonogrout 10K” by Sonneborn ChemRx, “Five Star Grout” by Five Star Products, Inc. or equal approved by the Architect.

6. Anchor Rod Hole Grout: Grout in oversize anchor rod holes at brace column steel base plates shall be “MasterFlow 816” by Master Builders, “Five Star Fluid Grout PT” by Five Star Products, Inc., “Quickcrete Cable Duct Grout” by Quickcrete, or equal approved by the Architect.

7. Flexible epoxy joint sealant shall be “SIKADUR 51 SL” by Sika Corporation, “Rezi-Weld Flex” by W.R. Meadows, “Dural 340” by Euclid Chemical Company, “Joint Tite 750” by L&M Construction Chemicals or equal approved by the Architect.

8. Underslab insulation shall be extruded tongue and groove polystyrene foam as manufactured by Dow, Johns Manville, Certain Teed, GAF or equal (molded bead polystyrene is not permitted). Underslab rigid insulation built up voids shall be EPS19 (40 PSI) Geofoam blocks as manufactured by Universal Foam Products, ACH Foam Technologies, Atlas EPS, or approved equal.

9. Mastic coating of structural steel below the top of slab on grade elevation shall be a high-build coal tar epoxy mastic as manufactured by Carboline, Inc., Sumter Coatings, Inc., Rust-Oleum, Inc., Krylon Industrial Coatings, Inc. or approved equal.

10. Threaded Inserts: Richmond Screw Anchor Co., or equal structural concrete inserts of type shown on Drawings. Galvanized all components in accordance with ASTM A 153.

2.03 CONCRETE MIXES

A. Strength, cement and water requirements:

Design Compressive Strength, f'c	Min. Cement Factor* Sacks/yd3	lbs/yd3	Max. Water Cement Ratio Gal/sack	Gal by wt.
3000	5.5	517	6.5	0.57
4000	6.5	611	5.5	0.44
5000	7.0	658	5.0	0.40

*Fly ash or slag may be used in all concrete except for interior slabs on metal deck, interior slabs on grade, exterior slabs or site walls. Amount shall be a maximum of 20% fly ash or 25% slag of the total cement content. Do not use slag during winter-concrete conditions.

B. All concrete shall be proportioned in accordance with ACI Standard 211.1, "Standard Practice for Selecting Proportions for Normal, Heavyweight and Mass Concrete" and comply with the requirements of ACI 301 "Specifications for Structural Concrete" Section 4, Method 1 (trial mixtures) or 2 (field test data).

C. All concrete with strengths 4000 psi and higher shall have a minimum coarse aggregate content of 1600 lbs./cu. yd.

D. Air-entraining and water-reducing agents shall be used in all concrete, in strict accordance with the manufacturer's printed instructions. All exterior concrete subjected to freezing and thawing shall have a total air content of 5% plus or minus 1%. All interior concrete slabs shall have a maximum air content of 3% and all other interior concrete shall have a total air content of 4% plus or minus 1%. Use a high range water-reducing agent (superplasticizer) in concrete for slabs on grade and slabs on steel deck.

E. Water-Cement Ratio - All concrete subjected to freezing and thawing shall have a maximum water-cement ratio of 0.44 (f'c = 4000 psi minimum). All concrete required to be watertight and/or subjected to de-icers shall have a maximum water-cement ratio of 0.40 (f'c = 5000 psi minimum). The maximum water-cement ratio for slabs on grade and slabs on steel deck is limited to 0.44. This is the total water in mix at time of placement, including free water of aggregates and liquid admixtures.

F. Slump of concrete shall be four inches (+/- one inch). If a superplasticizer is used, the slump shall be three inches (+/- one inch) prior to adding the superplasticizer and eight inches (+/- one inch) after adding the superplasticizer. Concrete for slabs on grade and slabs on steel deck shall include a superplasticizer.

G. Premix admixtures in solution form and dispense as recommended by the manufacturer. Include the water in the solution in the design water content of the mixtures.

PART 3 EXECUTION

3.01 STORAGE

A. All materials shall be stored to prevent damage from the elements and other causes.

B. Cement and aggregates shall be stored in such a manner as to prevent deterioration or intrusion of foreign matter. Any materials which have deteriorated, or which have been damaged, shall not be used for concrete.

C. Store reinforcing steel on wood skids to protect it from earth and damage from trucking or other construction operations. Reinforcement shall be free from loose mill scale, rust, release agent, concrete splatter and other extraneous coatings at the time it is embedded in the concrete.

D. All forms shall be stored in a neat manner and orderly fashion, protected from the weather and abuse.

E. Materials which are judged not acceptable for this project shall not be stored on the site, but shall be immediately removed from the site.

3.02 FORMING

A. Formwork construction shall be as specified in ACI 347 “Guide to Formwork for Concrete”.

1. Provide Class A tolerances for all visually exposed concrete surfaces.
2. Provide Class C tolerances for other concrete surfaces.

B. Acceptable tolerances shall be as specified in ACI 117 "Standard Specifications for Tolerances for Concrete Construction and Materials".

C. Forms shall be constructed to conform to shapes, lines, and dimensions shown, plumb and straight, and shall be maintained sufficiently rigid to prevent deformation under load. Forms shall be sufficiently tight to prevent the leakage of grout. Securely brace and shore forms to prevent displacement and to safely support the construction loads.

D. Treat forms with a form release agent applied according to the manufacturer's instructions, by roller, brush or spray to produce a uniform thin film without bubbles or streaks. Apply the release agent in two coats for the first use of the form and in one coat for each additional use.

3.03 MIXING PROCESS

A. Ready-mixed concrete shall be mixed and transported in accordance with "Specification for Ready-Mixed Concrete" ASTM C 94, Alt. #3 and ACI 304, “Recommended Practice for Measuring, Mixing, Transporting and Placing Concrete".

3.04 VAPOR RETARDER INSTALLATION

A. Sheet Vapor Retarders: Place, protect, and repair sheet vapor retarder according to ASTM E 1643 and manufacturer’s written instructions.

1. Lap joints six inches and seal with manufacturer’s recommended tape.

3.05 UNDERSLAB INSULATION

A. Insulation beneath slabs-on-grade – rigid insulation thickness per the Drawings.

1. Place insulation boards beneath slabs-on-grade at occupied areas only. Additionally, extend insulation downward at conditions indicated on the Drawings.

2. Butt edges and ends tight to adjacent boards. Bevel insulation to allow snug fit at cants.

3.06 REINFORCING

A. Reinforcing shall be securely tied and supported to maintain proper spacing and cover during placing operations. Take particular care to bend tie wire ends away from faces of walls. In no case shall ends of tie wires project towards or touch formwork. All reinforcing and accessories shall be placed in accordance with CRSI Standards 63 and 68. Reinforcing shall be free of excessive rust, scale or other coatings that will reduce bond.

3.07 EMBEDDED ITEMS

A. Coordinate the installation of all embedded items required by other trades. Such items normally are to be in place prior to the placing of reinforcing steel.

B. Place all anchor bolts, sleeves, inserts, and other embedded items and secure properly.

C. Conduits and Pipes by M.E.P. Contractors: Embed no pipes other than electrical conduit in structural concrete. Provide steel pipe sleeves for pipes passing through. Embed conduit in concrete only under the following conditions:

1. No conduit coating, except galvanizing or equivalent shall be used. Do not embed aluminum conduit in concrete.

2. Do not cut or displace any reinforcement.

3. Place conduit within the middle half of any member. Do not place conduit between concrete surfaces and reinforcement.

4. Place nearly parallel conduit apart at least three times O.D.

5. Do not place conduit in concrete toppings on metal deck.

3.08 JOINTS

A. Provide construction joints as shown on the Drawings, but in any case limit the maximum dimensions for placement of concrete in any one placement as follows:

1.	Walls:	80 feet
2.	Slabs-on-grade:	100 feet
3.	Slabs on metal deck:	100 feet

The time period between adjacent concrete pours on either side of the construction joint shall not be less than three days to allow for drying shrinkage in the initial pour.

B. Construction joints shall be formed with keyed bulkheads. At joint locations labeled on the drawings as roughened joints, the entire contact surface shall be mechanically roughened with a roughness of at least ¼ inch amplitude and an approved bonding agent shall be used in accordance with the manufacturer's recommendations. All construction joints shall be free of debris. Reinforcement shall continue through the joint, and additional reinforcement shall be placed as indicated on the Drawings.

C. Provide control joints as shown on the Drawings, but in any case limit the maximum dimensions between joints as follows:

1. Provide control joints at slabs on grade at each column line in each direction and at 15 feet maximum spacing in between.

D. Control joints shall be saw cut, as early as practical, the day after placement and finishing of concrete. Discontinue 50% of reinforcing at the joint. Do not place control joints in slabs on metal deck.

E. Provide isolation joints between slabs on grade and steel columns/gusset plates, and where shown on the Drawings. Isolation joint fillers shall be installed with removable top snap-caps so that the joint filler material to remain is ½ inch below the top surface of the slab to allow for joint sealants.

3.09 PLACING

A. Notify Architect at least 72 hours prior to each placement.

B. Do not place concrete until soil bearing material, reinforcing steel, inserts, sleeves and other work to be built into the concrete have been inspected and approved by the Architect and all trades concerned.

C. In hot weather, all concreting shall be done in accordance with ACI 305, "Recommended Practice for Hot Weather Concreting".

1. When temperature rises above 80 degrees F, all surfaces of concrete shall be protected against rapid drying.
2. Concrete delivered to the forms shall have a temperature of not over 90 degrees F.
3. The temperature of the forms shall not be over 90 degrees F.

D. In cold weather, all concreting shall be done in accordance with ACI 306, "Recommended Practice for Cold Weather Concreting".

1. When the average daily temperature falls below 40 degrees F, all surfaces of concrete shall be maintained at a temperature of at least 50 degrees F and not over 90 degrees F for seven days.
2. Concrete delivered to the forms shall have a temperature of at least 60 degrees F and not over 90 degrees F.
3. The temperature of the forms including gravel base, shall be at least 40 degrees F.
4. The Contractor shall maintain a record of temperature of the concrete at the most exposed surfaces of each placement at the beginning and at the end of each day of the curing period, which shall be available to the Architect.

E. Conveying - Concrete shall be handled from the mixer to the place of final deposit as rapidly as practicable by methods which will prevent separation or loss of ingredients and in a manner which will assure that the required quality of the concrete is retained.

F. Depositing - Delivery and placement of concrete shall be programmed so that the time lapse between batching and placement shall not exceed one and one half hours. Concrete shall not be allowed a free fall of over four feet. Concrete shall be deposited as nearly as practicable in its final position, to avoid segregation due to rehandling or flowing.

G. Concrete shall be deposited continuously, in horizontal layers of such thickness (not deeper than 18 inches) that no concrete will be deposited on concrete which has hardened sufficiently to cause the formation of seams or planes of weakness within the section. Placing shall be carried out at such a rate that the concrete which is being integrated with fresh concrete is still plastic. Concrete which has partially hardened or has been contaminated by foreign materials shall not be deposited.

H. Concrete shall be consolidated with the aid of mechanical vibrators in conformance with ACI "Recommended Practice for Consolidation of Concrete" to produce a dense, homogeneous mass without voids or pockets. Vibrators should be placed in concrete rapidly so as to penetrate the entire previous lift, to blend the two layers. Vibrating techniques must assure that when the coarse aggregate reaches the form, it stops and the matrix fills the voids.

I. Horizontal construction joints including those for toppings shall be mechanically roughened and cleaned thoroughly of all foreign materials and laitance, roughen with suitable tools such as chipping hammers or wire brushes, reclean by stream of water or compressed air and an approved bonding agent shall be used in accordance with the manufacturer's recommendations. New concrete shall be deposited before the bonding agent dries out.

3.10 FINISHING OF CONCRETE SURFACES

A. The intent of this Specification is to secure for the job, materials and workmanship of such quality that only nominal finishing will be required to produce concrete surfaces equal to the best obtainable with the concrete and forming materials specified. Surfaces which reveal, upon removal of forms, imperfections of such magnitude as to seriously impair the appearance of the structure, in the opinion of the Architect, shall be deemed cause for rejection, and concrete members containing such imperfections shall be entirely removed and replaced without damage to adjacent materials or extra expense to the Owner. Lesser imperfections of concrete surfaces shall be patched and finished in accordance with the following procedures.

B. Patching - Areas to be patched shall not exceed 1.5 square feet for each 1000 square feet of surface area. Patches shall match in every respect, the color and texture of the surrounding surfaces. Mix formulation shall be determined by trial to obtain a color match when both the patch and the surrounding concrete are cured and dry. After initial set, surfaces of patches shall be textured manually to obtain a match with the surrounding surfaces. All patches are subject to Architect's final acceptance as to appearance and quality.

C. Exposed Vertical Surfaces - Immediately after removal of forms, chip off all fins, and other projections, and patch all voids, honeycombs, and air pockets exceeding ¾ inch in any dimension. In areas where concentrations of small voids occur, patch a sufficient number of voids to produce a uniform appearance across the entire panel. Smooth out projections and fins with wet carborundum stones or power grinders to extent directed by Architect. Pull tie rods and pack voids formed by tie-rod cones to a point 3/4" from finish surface. Patch exposed irregular lines at edges of slab soffits to produce neat, uniform appearance.

D. Surfaces to Receive Sandblast Finish: Upon completion of operations under the preceding paragraph, sandblast all exterior vertical surfaces and all other surfaces indicated as receiving sandblast finish. No interior surfaces shall be sandblasted. Use a #400 gradation abrasive that will not adversely affect the color of the finished surface, such as “Black Beauty” supplied by M. B. Reed and Company, Inc., Hammond, Indiana, “Garnet Sand” supplied by Davidson MacDonald, Boston, Massachusetts, or approved equal. Abrasive blasting shall be carried out to the same depth and produce the same texture as the accepted sample panel throughout. Sandblasting shall be done after all concrete to be blasted has attained a strength of 3,000 psi as determined by field control cylinders, or after a minimum of seven days, whichever is first. The Contractor shall be responsible for safety of the workmen and for any damage or claims resulting from this operation and shall equip each person with an air-fed helmet. Provide suitable enclosures for collecting grit and dust from the blasting operation. During abrasive blasting, surfaces intended to be left smooth, such as rustications, chamfers and tie cone holes, shall be protected from blasting by masking with wood, metal, rubber or tape. Avoid rounding edges. All inserts shall be masked and protected from blasting. Sandblasting shall comply with all local and state anti-pollution laws.

E. Finishing Concrete Vertical Surfaces Exposed to View and not scheduled to be sandblasted: Provide a smooth-formed surface obtained with selected form-facing material arranged in an orderly and symmetrical manner with a minimum of seams. Repair and patch defective areas with fins and other projections completely removed and smoothed.

Smooth-Rubbed Finish: Provide smooth-rubbed finish on exposed concrete vertical surfaces that have received smooth-formed finish treatment not later than one day after form removal. Moisten concrete surfaces and rub with carborundum brick or another abrasive until producing a uniform color and texture. Do not apply cement grout other than that created by the rubbing process. Thoroughly clean surfaces to remove stains, laitance, dust, form oil, and all other surface residue by use of water, stiff brushes, sandpaper or other means approved by the Architect.

F. Finishing of Concealed Concrete Surfaces - At surfaces to receive waterproofing membranes, chip off fins and other projections and trowel patch all voids, honeycombs and air pockets exceeding one half inch in any dimension. Pull tie-rods and patch voids formed by tie-rod cones flush with adjacent surfaces. At outside faces of foundation walls, except for surfaces to receive waterproofing membranes, trowel patch all voids, honeycombs and air pockets exceeding ¾ inch in depth. At other concealed surfaces, patching, if any, shall be as directed by the Architect and shall, in general, be only such as is required to assure or protect the structural integrity of concrete or reinforcing.

3.11 FLOOR AND OTHER FLATWORK FINISHES

A. Concrete for finish floor slabs shall be poured as dry as practicable within allowable slump range. Except when otherwise indicated or specified, concrete floor slabs shall be monolithically finished at required elevation by screeding, floating, and troweling (if required) to provide a smooth, even, non-porous finish, free of finishing marks. Do not begin finish troweling until concrete has hardened sufficiently to prevent excess fines from working to the surface. Finish requirements for concrete slabs on deck and concrete slabs on grade are as follows (but must be coordinated with the requirements of the selected flooring manufacturers and contractors):

Float Finish: Slabs to receive unbonded toppings, steel trowel finish, mortar setting beds, equipment pads, and other similar surfaces shall be floated to a smooth, dense, uniform, sandy textured finish. During floating, while surface is still soft, check surface flatness using a 10 foot highway straight edge. Correct high spots by cutting down and correct low spots by filling with material of the same composition as floor finish.

Light Steel Trowel Finish: At areas to receive resilient floor covering, carpeting, or other floor covering, perform a light steel troweling immediately after floating. These areas shall be prepared in accordance with ASTM F 710: Standard Practice of Preparing Concrete Floors to Receive Resilient Flooring.

Steel Trowel Finish: At floors to remain exposed to view, steel trowel immediately after floating. After initial troweling is complete and slabs have set sufficiently to ring the trowel, the surfaces shall be given a second steel troweling to a burnished finish.

Scratch Finish: At areas to receive a bonded, applied cementitious application, finish base slab as indicated above, except bull floats or darbys may be used. Thoroughly coarse wire broom within two hours after placing to roughen slab surface to ensure a permanent bond between base slab and applied cementitious materials.

Broom Finish: Provide edged and jointed broom finish for exposed concrete pavements, ramps, stairs, and other similar surfaces. Slab surfaces shall be float finished following the procedures listed below. Following the float finish, use a moistened, stiff bristled natural fiber broom with a long handle to obtain a heavy brush texture finish. Install brush marks perpendicular to the flow of traffic. Repeat edging and jointing operations as required to obtain a distinct edge. Match texture approved by Architect from sample panel.

B. Concrete for floor slabs on metal deck shall be poured to the proper elevations by adding concrete to compensate for deck and structural member deflections. Composite steel beams are designed to be unshored. Slab thickness indicated on drawings is a minimum. Assume one and one quarter inch additional thickness concrete at mid-bay required.

C. Concrete floor slabs shall conform to the following flatness and levelness tolerances per ASTM E1155 for Specified Overall Values (SOV) and Minimum Local Values (MLV):

Carpeted areas:

Floor Flatness Number FF:	Specified Overall Value (SOV) = 25 Minimum Local Value (MLV) = 17
Floor Levelness Number FL:	Specified Overall Value (SOV) = 20 Minimum Local Value (MLV) = 15

Exposed areas or areas to receive wood flooring, resilient flooring, or thin set tile:

Floor Flatness Number FF:	Specified Overall Value (SOV) = 35 Minimum Local Value (MLV) = 25
Floor Levelness Number F_L:	Specified Overall Value (SOV) = 20 Minimum Local Value (MLV) = 15

Measurements shall be taken by the Testing Agency in accordance with ASTM E1155. Measurements shall be taken within 72 hours of concrete placement to verify compliance with FF and FL requirements. Leveling of the slab by the Contractor to the required tolerances, if not achieved by initial finishing, shall be by machine grinding or by special leveling compound, or both, as approved by the Architect.

Note: Only F_F numbers are applicable to elevated reinforced concrete slabs and slabs on metal deck. Both F_F and $F_{L.}$ numbers are applicable to slabs on grade.

D. Elevation Tolerance: The top surface elevation of slabs on metal deck and slabs on grade must not vary from the specified design elevation by more than +/- 3/8 inch (3/4 inch envelope), as measured at 80% of all points.

E. Concrete slab surfaces to be sloped shall be sloped uniformly to drains.

F. Concrete slabs to receive Portland cement setting beds or concrete or fills shall be given a rough wood float or broom finish.

G. Provide edged and jointed broom finish for exposed concrete pavements. Immediately following floating of surfaces to have broom finish, steel trowel the surface. Use a stiff bristled natural fiber broom with a long handle to obtain a heavy brush texture finish. Install brush marks perpendicular to the flow of traffic. Repeat edging and jointing operations as required to obtain a distinct edge.

H. No dry cement or mixture of sand and cement shall be applied to surface of any concrete slab to absorb moisture.

I. Protect floors from damage until completion of job.

3.12 SURVEY

A. The Contractor shall engage the services of a licensed Engineer or Surveyor to provide as-built elevation surveys of concrete slabs at all levels.

B. Surveys shall be taken prior to removal of shoring, as applicable.

C. Slab elevation readings shall be taken at each column, mid-way between columns on each column in each direction, and at mid-bay.

D. Submit a summary of results at each level for review by the Architect. Additional readings may be requested, at the direction of the Architect. Floor leveling, if required, shall be as specified in Paragraphs 2.01 H and Section 3.15.

3.13 CURING AND PROTECTION

A. Protect newly placed concrete against low and high temperature effects and against rapid loss of moisture. Cure all concrete for at least seven days at a temperature of at least 50 degrees F by curing methods approved by the Architect.

B. Vertical or near vertical surfaces may be cured by maintaining wood forms continuously wet during curing period, by wrapping with continuous .006 inch polyethylene with taped joints or as approved by the Architect.

C. Floor surfaces, after hardening sufficiently to prevent damage, and normally within several hours after final troweling, shall be treated with the approved curing cover sheets with taped, lapped seams.

3.14 FORM REMOVAL

A. Forms shall be removed without damage to concrete. The Contractor shall be responsible for the safety of the construction during and after form removal. No act of the Architect shall relieve him of this responsibility.

B. Protect corners from damage after form removal by boxing, corner boards or other means approved by the Architect.

C. Formwork for pilasters, walls, and other parts not supporting the weight of concrete may be removed as soon as the concrete has reached 30% of its specified 28-day strength, but not before 2 days, provided it is properly cured and protected.

D. Foundation walls to retain earth shall not be backfilled until the connecting slabs at the top and bottom of the wall have achieved their 28-day strength. Alternatively, the contractor may provide an engineered wall bracing system to withstand wall earth pressures during construction prior to slab bracing.

3.15 FLOOR LEVELING

A. Place self-leveling concrete underlayment for floor leveling in accordance with manufacturer's recommendations:

1. Remove all dirt, grease, and sealers from existing slab by sandblasting or power washing.

2. Prime and seal entire surface to receive topping. Use bonding agent, applied in strict conformance with manufacturer's instructions.

3. Pour or pump, mixed rough course of underlayment material onto primed area in accordance with manufacturer's instructions, filling areas to within ¾ inch of finish elevation at mid-bay. This rough course shall consist of the underlayment material, mixed with fine gravel aggregate (3/8 inch maximum size), as applicable and as required by manufacturer.

4. After allowing rough course to set, prime with bonding agent and place finished course of underlayment material to within ¼ inch of finish elevation at mid-bay. Protect newly applied underlayment from premature surface drying and moisture loss.

3.16 WATERSTOP

A. Install continuous Bentonite strip waterstop at vertical and horizontal below grade wall construction joints. Installation shall be in accordance with manufacturer's recommendations.

3.17 MASTIC COATING OF EMBEDDED STRUCTURAL STEEL

A. Install mastic coating continuously over steel embedded in concrete or soil in accordance with the manufacturer's recommendations.

3.18 CUTTING OF HOLES

A. Holes required by other trades in any cast-in-place concrete which did not receive sleeves shall be cut by the respective trades. Use a core drilling process or sawing process which produces clean sharp edges and the minimum hole size which accommodates the piping, conduit, or equipment requiring the opening. Field locate all reinforcing bars prior to coring and do not cut bars.

B. Obtain approval of Architect before cutting any holes for any trades.

3.19 FLOOR HARDENING

A. Unless otherwise specified, all interior concrete floors remaining exposed in the finished work shall be treated with a chemical hardener in a three-coat application, not sooner than 28 days after pouring of slab, in accordance with manufacturer's specifications.

3.20 NON-SHRINK GROUT

A. Grout solid all column leveling plates and beam bearing plates in accordance with manufacturer's recommendations.

3.21 ANCHOR ROD BASE PLATE HOLE GROUT

A. Grout solid all oversize brace column steel base plate holes around anchor rods in accordance with manufacturer's recommendations.

END OF SECTION

Division 4
Masonry

SECTION 040001

MASONRY

*(Filed Sub-Bid Required)

PART 1 GENERAL

1.00 TIME, MANNER AND REQUIREMENTS FOR SUBMITTING SUB-BIDS

A. Sub-bids shall be submitted in accordance with provisions of the General Laws (Ter. Ed.), Chapter 149, Section 44A to 44L, inclusive, as amended. The time and place for submission to Sub-Bids shall be set forth under INSTRUCTIONS TO BIDDERS.

B. Each Sub-Bid filed with the Awarding Authority must be accompanied by BID BOND, or CERTIFIED CHECK, or TREASURER'S CHECK, or CASHIER'S CHECK issued by a responsible bank or trust company, payable to the **City of Amesbury**, in the amount stipulated in the INSTRUCTIONS TO BIDDERS. A Sub-Bid accompanied by any other form of bid deposit than those specified will be rejected.

C. Each Sub-Bid submitted for the work, under this SECTION, shall be on a form furnished by the Awarding Authority and required by SECTION 44F of Chapter 149 of the General Laws, as amended.

D. Work to be performed under this SECTION is shown on Contract Drawings numbered:

G.0.01, G.0.02, G.0.04-G.0.08, inclusive; 1.1.01-1.1.14, inclusive; 1.5.01-1.5.06, inclusive; 2.1.00-2.8.03, inclusive; 3.4.01-3.9.15, inclusive; 4.1.01-5.4.11, inclusive; 6.1.00-6.2.01, inclusive; 7.4.01-7.4.03, inclusive; 8.4.01-8.5.03, inclusive; 9.4.01-9.8.07, inclusive; and 10.0.01-10.3.13, inclusive.

Remaining Contract Drawings are included for reference and coordination.

E. LEEDv4-S Requirements:

1. The work of this Section includes material and submittal requirements for fulfillment of Project LEEDv4-S Certification. LEEDv4-S Certification at “Silver” Level is an Owner Requirement that is critical to secure project funding from the Massachusetts School Building Authority. LEEDv4-S requirements for the work of this Section are detailed herein, and additionally in DIVISION 1 of this Project Manual.
2. For all adhesives and sealants, meet the requirements for IEQ Credit 2, Low-Emitting Materials as defined in SECTION 018113-SUSTAINABLE DESIGN REQUIREMENTS.

1.01 GENERAL REQUIREMENTS

A. PART A and DIVISION 1 of PART B are hereby made a part of this SECTION.

B. Examine all conditions as they exist at the project prior to submitting a sub-bid for the work of this SECTION.

1.02 SCOPE OF WORK

A. Furnish and install the following items required to complete the work of this SECTION, as shown on the Contract Drawings and specified herein:

1. Face brick.
2. Ground face (GF-CMU) concrete masonry units.
3. Concrete masonry units, including bullnose corners, cap blocks (2 and 3 sided), bullnose bases (2 and 3 sides), and concrete brick.
4. Colored precast concrete bases, caps, and lintels.
5. Natural stone veneer at site wall.
   Note: Adjustment to the percentage mix of light and medium stones may be required to achieve design intent of medium warm greys.
6. Bluestone cap at site wall.
7. Colored mortar at brick and GF-CMU and regular mortar at CMU.
8. Pointing mortar at precast elements.
9. Grout fill for concrete masonry units and pressed metal frames (in masonry walls), and where required for anchorage of the work of other trades.
10. Drainage fill in exterior cavity of masonry veneer walls, wherever through-wall flashing occurs therein.
11. Membrane through-wall flashing installed in soft mortar joints of masonry exterior cavity walls, including metal drip edge.
12. Reinforcement and anchorage items for masonry work, including horizontal and vertical reinforcing, lintel beam reinforcing, and all grouting except vertical reinforcing imbedded in concrete and/or welded to structural steel. (Refer to Structural Drawings.)
13. Compressible filler for major expansion joints in masonry, in joints between tops of interior masonry partitions and under side of metal decking, and in other locations in masonry as indicated on the Drawings.

B. Furnish the following for installation under the designated SECTIONS:

1. Prefabricated metal anchor slots: SECTION 051200-STRUCTURAL STEEL.
2. Dovetail anchor slots for receipt of dovetail anchors wherever masonry abuts, or is backed by, concrete walls: SECTION 033000-CAST-IN-PLACE CONCRETE.

C. Install the following items as furnished by the designated SECTIONS:

1. Loose Steel Lintels: SECTION 055000-MISCELLANEOUS METALS.

2. Anchor bolts, access panels and other items furnished by other trades requiring same.

3. Anchors for louvers in masonry: SECTION 2300010-HVAC.

4. Sleeves for piping and conduit, as furnished by the Fire Protection, Plumbing, Mechanical and Electrical SECTIONS, unless otherwise specified.

5. Preformed and prefinished sill flashing and base wall flashing to be incorporated into masonry walls at termination of PVC roofing: SECTION 074213-PREFORMED CLADDING.

6. Rigid cavity wall insulation at masonry veneer walls: SECTION 072100-INSULATION.

D. This Subcontractor shall furnish, install and maintain in safe adequate condition all lifts, hoisting, staging and scaffolding that are necessary for the proper execution of the work in this Section.

E. LEEDv4-S Requirements:

1. The work of this section includes material and submittal requirements for fulfillment of Project LEEDv4-S Certification. LEEDv4-S Certification at "Silver" Level is an Owner Requirement that is critical to secure project funding from the Massachusetts School Building Authority. LEEDv4-S requirements for the work of this Section are detailed herein, and additionally in DIVISION 1 of this Project Manual.

1.03 RELATED WORK SPECIFIED ELSEWHERE

A. The following related work is to be performed under the designated SECTIONS:

1. Construction of mock-up: SECTION 014339-EXTERIOR MOCK-UPS.

2. Temporary protection and temporary heating: SECTION 015000-TEMPORARY FACILITIES AND CONTROLS.

3. Masonry, in conjunction with site utilities: SECTION 334000-STORM DRAINAGE.

4. Roof flashings, fascias and roof pads: SECTION 070002-ROOFING AND FLASHING.

5. Sills of fenestration and wall panels: SECTION 074213-PREFORMED CLADDING and SECTION 080001-METAL WINDOWS.

6. Caulking and sealant materials (including joint bead back-up), and dampproofing: SECTION 070001-WATERPROOFING, DAMPPROOFING, AND CAULKING.

7. Continuous Air Barrier: SECTION 071326-AIR AND VAPOR BARRIERS.

8. Ceramic tile walls and floors in toilets: SECTION 090002-TILE.

9. Drywall back-up system for masonry veneer: SECTION 092116-GYPSUM WALLBOARD.

10. Insulation at top of masonry walls at decking and structural steel penetrations at masonry: SECTION 06100-ROUGH CARPENTRY.

11. Steel seismic clip angles at top of masonry walls: SECTION 050001-MISCELLANEOUS AND ORNAMENTAL IRON.

12. Installation of exterior rigid and semi-rigid insulation behind metal wall panels and rainscreen systems: SECTION 074213-PREFORMED METAL CLADDING, SECTION 074247-FIBER REINFORCED CONCRETE PANEL RAINSCREEN SYSTEM and SECTION 074233-PHENOLIC RAINSCREEN SYSTEM, respectively.

13. Firestopping and smoke stopping (except at top of masonry walls and underside of metal deck): By Trade requiring penetrations thorough walls.

14. Aluminum louvers for mechanical equipment: SECTION 230001-HVAC.

15. Intercom, file alarm, door operator actuators and other electric devices mounted in masonry: SECTION 260001-ELECTRICAL and DIVISIONS 27 and 28.

1.04 SUBMITTALS

A. Submit the following samples in accordance with the requirements of SECTION 013300-SUBMITTALS.

1. Face brick: One full strap in each specified color and size.

2. Ground face CMU: One full unit, for each specified color and size.

3. Concrete masonry unit: One full unit, 7 and 5/8 inches thick of specified size.

4. Precast Concrete: Color samples in full range of manufacturer's colors and one custom color match if subsequently requested.

5. Natural stone: One strap, full color range.

6. Through-wall flashing and drip edge: 12-inch x 12 inch in 12 inch length, respectively, of specified type.

7. Reinforcement, anchors, and ties: One piece of each type specified.

8. Mortar color samples of full range of available colors. Up to 10 real mortar samples mixed with specified mortar in correct proportions of colors chosen from full kit.

9. Bluestone wall cap: (2) samples with specified finish and full color range of the material illustrated.

B. Submit with masonry unit samples complete data and tests for each type of masonry. The Architect reserves the right to request and obtain additional data if required and to reject the proposed materials if not in accordance with the Specifications.

C. LEED for Schools Submittals (Refer to SECTION 013300-SUBMITTALS):

1. Relevant supporting documentation required by LEED for School v4 and as detailed in SECTION 018113-SUSTAINABLE DESIGN REQUIREMENTS.
2. A completed LEED MATERIALS REPORTING FORM, per SECTION 018113-SUSTAINABLE DESIGN REQUIREMENTS.
3. Product substitution requests are subject to additional LEEDv4-S submittal requirements. Refer to SECTION 012500-SUBSTITUTION PROCEDURES.

D. Material Certificates: Include statements of material properties indicating compliance with requirements including compliance with standards and type designations within standards. Provide for each type and size of the following:

1. For structural masonry, include data and calculations establishing average net-area compressive strength of units.
2. Cementitious materials, including brand, type, and name of manufacturer.
3. Pre-blended, dry mortar mixes. Include description of type and proportions of ingredients.
4. Grout mixes complying with compressive strength requirements of ASTM C476. Include description of type and proportions of ingredients.
5. Reinforcing steel bars.
6. Joint reinforcement.
7. Anchors, ties, and metal accessories.

E. Shop Drawings: Show fabrication and installation details for the following:

1. Precast Concrete Trim Units: Show sizes, profiles, anchorage and location of each trim unit required.
2. Reinforcing Steel: Detail bending and placement of unit masonry reinforcing bars. Comply with ACI 315, “Details and Detailing of Concrete Reinforcement.” Show elevations of reinforced walls.
3. Job specific through wall flashing details.

F. Hot and Cold Weather Masonry Procedures as described in this SECTION.

1.05 MOCK-UP PANEL STRUCTURE

A. After receipt of Architect's approval of above materials, build mock-up panels of typical exterior wall comprised of full range of selected and approved brick veneer, masonry, precast cap, insulation, with specified bond, joints and reinforcing. Refer to SECTION 014339-EXTERIOR MOCK-UPS for panel size and configuration.

B. Provide and install masonry work to exterior wall mock-up panels as shown on the Drawings. Mock-up panel shall include brick, CMU, precast concrete, mortar and all insulation, ties, for a complete masonry installation as shown on the mock-up panel drawings. The final mock-up structure shall be left on site to serve as the reference standard for appearance and workmanship as the work progresses. This subcontractor shall, at no additional cost to the Owner, rebuild the portions of the mock-up furnished and installed under this SECTION using the final approved materials, colors and construction to complete the final mock-up.

C. Refer to SECTION 014339-EXTERIOR MOCK-UPS for sizes, configuration and other requirements for the mock-up panel structure.

D. Approval of mock-ups does not constitute approval of deviations from the Contract Documents contained in mock-ups unless Architect specifically approves such deviations in writing.

E. Mock-up panel structure will not remain as part of the Work.

F. **Do Not** proceed with masonry work until sample panels have been approved by the Architect. Leave panel on site for comparison with the project workmanship and remove when directed. The Architect reserves the right to require up to three panels to be erected until sample and workmanship is satisfactory to the Architect.

1.06 REFERENCE STANDARDS (LATEST EDITIONS)

A. Comply with the following codes for all materials, methods, and workmanship, not otherwise specified:

1. The National Concrete Masonry Association Standard "Specifications for the Design and Construction of Load Bearing Concrete Masonry."
2. "Recommended Practices for Cold Weather Masonry Construction" by the International Masonry Industry All-Weather Council."
3. Recommendations of the "Brick Institute of America."
4. ASTM C 652 - Standard Specification for Hollow Brick.

B. The above referenced standards are in addition to ASTM and other standards specified herein constitute minimum requirements. In case of conflict between referenced standards and/or with specified requirements, the more stringent requirements shall govern.

1.07 PRODUCT, DELIVERY, STORAGE AND HANDLING

A. Handle and store all materials so as to prevent damage or intrusion of foreign matter.

B. Stack masonry units on platforms. Store masonry under a waterproof cover that permit circulation of air and prevents excessive moisture absorption. Store cement and lime in weather-tight sheds with elevated floors. Locate storage piles to avoid being disturbed or damaged by construction activities.

C. Store metal accessories indoors and protect against rust and other damage.

D. Materials in broken containers or in packages showing watermarks or other evidence of damage, shall not be incorporated in to the work and shall be removed from the site.

E. Do not deliver cement, lime, and similar perishable materials to the site until suitable storage is available. Store such materials in weatherproof structures and ensure that materials are in perfectly fresh condition when brought out for use.

1.08 JOB CONDITIONS

A. Do not erect any masonry when temperature of surrounding area is below 40 degrees F., or below 45 degrees F. and falling, or forecast by public news media to fall, to or below 35 degrees F. within 24 hours except where weather protection materials have been furnished in accordance with SECTION 015000-TEMPORARY FACILITIES AND CONTROLS. Do not use masonry materials which are observed to contain frost or are covered with ice or snow and heat all masonry materials to 40 degrees F immediately before installation. Do not mix anti-freezing or accelerating ingredients with any mortar. Mortar shall not be permitted to freeze, or be damaged from frost, and take down any completed work found to be affected by frost and rebuild without change in the Contract Price.

B. Protect fresh and uncompleted masonry against the elements when not being worked on by the use of non-staining weather proof coverings, properly held in place.

C. Calcium chloride or admixtures containing calcium chloride will not be permitted in the performance of the work of this SECTION.

D. Hot-Weather Requirements: Protect unit masonry work when temperature and humidity conditions produce excessive evaporation of water from mortar and grout. Provide artificial shade and wind breaks and use cooled materials.

1. When ambient temperature exceeds 100 degrees F, or 90 degrees F, with a wind velocity greater than 8 mph, do not spread mortar beds more than 48 inches ahead of masonry. Set masonry units within one minute of spreading mortar.

PART 2 PRODUCTS

2.00 LEEDv4-S REQUIREMENTS

A. Products and materials used for this section of the work are required to meet the following criteria for LEEDv4-S materials Credits, and a completed LEEDv4-S Materials Reporting Form shall be submitted for all materials in this SECTION:

1. Recycled Content. (See Section 018113 Sustainable Design Requirements for overall project recycled content requirements.) The General Contractor shall examine each product or material specification below for a stated minimum recycled content requirement, and if none is stated, the requirements under 018113 shall govern.
2. Regional Content. (See Section 018113 Sustainable Design Requirements for overall project regional content requirements.) The General Contractor shall examine each product or material specification below for a stated minimum regional content requirement, and if none is stated, the requirements under 018113 shall govern.
3. Furnish any adhesives and sealants applied on site and inside the weatherproofing such that they meet the requirements for IEQ Credit 2, Low-Emitting Materials as defined in SECTION 018113-SUSTAINABLE DESIGN REQUIREMENTS.

2.01 MASONRY MATERIALS

A. Face Brick (New Elementary School):

1. To establish a standard of quality and level of color design, the basis of design brick shall be manufactured by Endicott as follows:
   a. Brick Type 1 (Field) – Ruby Red Blend Velour Norman
   b. Brick Type 2 (Accent – Canopies and as otherwise shown on the drawings) – Medium Ironspot Velour #46 Modular
2. Nominal Dimensions:
   a. Norman Brick: 12 in. long x 2-2/3 in. high x 4 in. deep
   b. Modular Brick: 8 in. long x 2-2/3 in. high x 4 in. deep
3. Units by Endicott, Belden, Carolina Ceramics, Interstate, Sioux City or other manufacturers matching the specified units in color, appearance, physical and performance criteria will be considered for approval as an equal by the Architect upon receipt of adequate supporting data and samples.
4. Face brick shall be hard burned brick with water absorption of not more than 7.87 percent for an average of five bricks when tested by the five-hour boiling test in accordance with American Society of Testing Materials Designation C67 and which shall conform to the requirements of ASTM C216, Grade SW, Type FBA. Test reports to be submitted with samples as follows:
   a. Test reports for each type to be submitted to the Architect.

b. Test reports are to be prepared by an independent testing laboratory.

c. Tests shall include:

1) Compressive strength

2) 24-hour cold water absorption

3) 5-hour absorption

4) Saturation coefficient

5) Initial amounts of absorption (suction)

6) Efflorescence (none allowed)

5. Provide special molded shapes where indicated and for application requiring brick of form, size and finish on exposed surfaces which cannot be produced from standard brick sizes by sawing.

6. For applications resulting in exposure of brick surfaces which otherwise would be concealed from view, provide uncored or unfrogged units with all exposed surfaces finished.

B. Face Brick (Cashman School)

1. To establish a standard of quality and level of color, texture, flash and finish, the basis of design brick shall be manufactured by Morin as follows:

a. Brick Type 3 (Cashman retaining wall) – 50/50 mix: Blackstone / Brownstone water struck modular.

2. Nominal Dimensions:

a. Modular Brick: 8 in. long x 2-2/3 in. high by 4 in. deep.

3. Units by Glen Gery, Ragland or other manufacturers matching the specified units in color, appearance, physical and performance criteria will be considered for approval as an equal by the Architect upon receipt of adequate supporting data and samples.

C. Concrete Masonry Units (CMU) and Concrete Lintel Units

1. CMU shall be purchased from a single manufacturer.

2. Masonry units shall be of standard height, sound, and true to plane and line. Where faces of units remain exposed, extreme care shall be used in handling of such units. Chipped or discolored units will be rejected by the Architect, and such units shall be immediately removed and replaced with undamaged units.

3. Blocks shall be free of all materials which may cause pop-outs and staining.

4. Where a required fire rating is indicated on the drawings, provide units meeting that rating in accordance with the equivalent thickness method of the American Insurance Association.

5. Provide bullnose units (caps and bases) at all outside corners and top of low walls.

6. All CMU shall be Normal weight Concrete Masonry Units (CMU) with the following properties:

   a. Hollow units shall comply with all provisions of ASTM C90-16

   b. Solid units shall comply with all provisions of ASTM C90-16. Refer to Drawings for locations of solid units.

7. LEEDv4-S Requirements: CMU units shall qualify as Regional Materials.

D. Ground Face (GF-CMU) Concrete Masonry Units: To establish a standard of quality, design and color range, specifications and drawings have been based on GF-CMU, ground face finish as manufactured by Jandris and Sons. Similar units by Trenwyth Industries, D'Agostino Building Blocks, and other manufacturers matching the specified physical and performance criteria, colors and appearance will be considered for approval as an equal by the Architect, upon receipt of adequate supporting data and samples.

1. Ground face concrete masonry units (GF-CMU) shall be architectural facing units conforming to ASTM C90-16 and the following requirements:

   a. Solid GF-CMU shall be used where indicated on the Drawings and in any locations where cores would be exposed. All other GF-CMU shall be hollow load bearing.

   b. Refer to the Drawings for ground face lintel blocks and for shapes and dimensions of GFCMU. Provide shapes and sizes shown on the drawings. Custom block shapes shall be either cut or cast to the dimensions shown, with all exposed to view surfaces ground to specified finish.

   c. All exposed faces including ends and outside corners of GF-CMU shall be ground for uniform appearance. Refer to the drawings for locations where both sides of GF-CMU units are exposed and unpainted.

   d. Physical Properties

Hollow GF-CMU	Solid GF-CMU	
2000psi	2000psi	Min. average compressive strength on gross area
0.065	0.065	Max. average drying shrinkage percent
0.75	0.75	Max. saturation coefficient

   Maximum Water Absorption allowed lb. /cu. ft. for oven dry density Normal Weight is 13, Medium Weight is 15, Light Weight is 18 for an average of three units.

   e. Size: GF-CMU units shall be nominally 4 in. x 16 in. x 4 in. and 8 in. x 16 in. x 4 in.

f. Color surface texture and aggregate exposure shall be uniform within the normal range represented by the approved sample wall panel erected at the job site. Colors to be as follows:

1) Exterior: 9300 Series: 9303

2) Interior: Plymouth Series: P-107

g. All GF-CMU shall be sound and free of cracks or other defects.

h. The supplier shall submit a notarized certificate stating that the units supplied will conform to the Specifications set forth herein.

E. Natural Stone Veneer: To establish a standard of quality, design and color range, specifications and drawings are based Fond du Lax "Manor" natural thin veneer stone by Natural Stone Veneers International, Fond du Lac, WI. Similar units matching colors and appearance by Glen-Gery; Adirondack Square Fieldstone", McGregor "Architectural Stone" or other manufacturers will be considered for approval as an equal by the Architect upon receipt of adequate supporting data and samples.

1. Pattern: "Fond du Lac Manor".

a. Height: 4 inches to 12 inches (102 mm to 305 mm).

b. Length: 8 inches to 20 inches (203 mm to 508 mm).

c. Corner Trim Units: To simulate full-bed installation, shall be in a variety of lengths and equal numbers of "long-leg right" and "long-leg left" fabrications.

d. Nominal Thickness: 3/4 inch to 1-1/2 inches (19 mm to 38 mm).

e. Color: Shades of light and warm medium grays in range and proportion of approved samples.

f. Material: Limestone, rated as Type III High Density when tested in accordance with ASTM C 568.

2. Mortar:

a. Cement: ASTM C 270.

b. Lime: ASTM C 207.

c. Sand: ASTM C 144, natural or manufactured.

d. Color Pigments: ASTM C 979, mineral oxide.

e. Water: Potable.

f. Pre-Packaged Latex-Portland Cement Mortar: ANSI A118.4 or ANSI A118.15.

3. Bonding Agent: Acrylic additive.

4. Mortar Mixes:

a. Grouted Joints:

1) Mortar Mix: ASTM C 270, Type S.

2) Add color pigments to mortar in accordance with pigment manufacturer's instructions.

b. Jointless Dry-Stack Installation:

1) Mortar Mix: ANSI A118.4 or ANSI A118.15.
2) Add color pigments to mortar in accordance with pigment manufacturer's instructions.

F. Bluestone Materials for Site Wall Cap

1. General:

a. Bluestone: Full blue: "New York Blue-Blue", free of cracks, seams or starts which may impair its structural integrity or function.

b. Inherent variations characteristics of the quarry from which it is obtained will be acceptable.

c. Color, texture and finish shall be within the range of samples submitted and approved. Submit blue-blue green stone samples.

d. Provide matched blocks from a single quarry or other source for each type, variety, color and quality of stone required. Extract blocks from a single bed of quarry stratum, especially reserved for project, unless stones from randomly selected blocks are acceptable to Landscape Architect for aesthetic effect.

2. Bluestone Wall Cap: Sawn bluestone with 1/8-inch pencil eased top and corner edges, thermal finish all exposed faces.

a. Cap Dimensions: As shown on the Drawings.

3. Latex Grout and Mortar Admixture: "Laticrete 8510" by Laticrete International, Inc. (800) 243-4788.

Physical Properties:

Compressive Strength – 3,500 psi minimum
Bond Strength at 24 hours – 500 psi minimum
Water Absorption – 6 percent maximum

4. Moisture Resistant Mortar Additive: Ammonium stearate, aluminum tri-stearate or calcium stearate.

5. Water: Fresh, clean and non-alkaline water as available from the Contractor. Transport as required.

2.02 MEMBRANE FLASHING MATERIALS

A. Membrane Flashing – Blueskin TWF as manufacturer by Henry Co., W.R. Meadows Air Shield, Williams Products Everlastic MF-40 or an approved equal, a self-adhered membrane specifically designed for use as thru-wall flashing and consisting of an SBS rubberized asphalt compound integrally laminated to a yellow cross-laminated HDPE film, total thickness 40 mils.

5. Include any associated primers, termination sealants and other products required for a complete system.

B. Drip Edge – Installed beneath membrane flashing as it exits the cavity where shown on the drawings, formed stainless steel drip edge as manufactured by Sandell Manufacturing Co., Wire-Bond, RKL Building Specialties or an approved equal. Setting bed sealant shall be Dow Corning 790, Tremco Spectrem 1, Pecora 890, GE Silpruf SCS-9000 NB silicone building sealant or an approved equal.

2.03 MORTAR AND JOINT MATERIALS

A. Mortar shall conform to ASTM C270 "Mortar for Unit Masonry." Refer to paragraph 3.02 for mortar mixes and types.

B. Cement – An approved brand of domestic Portland cement, conforming to ASTM C150, Type I as approved by the Architect. Portland Cement shall be supplied by a single manufacturer throughout the work of this section to assure consistency of results.

C. Sand – Clean, washed, uniformly well graded, conforming to ASTM C144. Sand shall be light in color and obtained from a single source.

D. Lime – Approved brand of plastic hydrated, such as New England 4X, conforming to ASTM Specification C207, Type S.

E. Mortar colorant for all exterior mortar – Horn Staybright, Master Builders Colomix, Flamingo-BRIXENT, based on Solomon Colors A Series or approved equal. Colors shall be:

1. Dark Brown 35H at brick types 1 and 2
2. Portland Cement at ground face CMU.
3. Colors to match existing mortar at brick type 3.

F. Integral waterproofing for all exterior mortar – Omicron Mortar-proofing by the Master Builders Co., "Hydrocide" by C.G. Pardee Co., Inc., Dry-Block by WR Grace or an approved equal.

G. Compressible joint filler – Glass fiber board, six pounds per cubic foot density, 25 percent greater in thickness than width of joint.

H. Mortar Net – High density polyethylene strands woven into a 90% open mesh, 2 in. thick x 10 in. high x 5 feet long, “Mortar Net” by Mortar Net Solutions, No. 84 Weep-thru Mortar Deflector by Heckman, Mortar Trap Weep Vents by Hohmann and Barnard, Inc., or an approved equal.

I. Weep-holes – Rectangular plastic weep holes, 3/8 in. x 1-1/2 in. high x 3 ½ in. long, Hohmann & Bernard “QV-Quadro-Vent”, Heckman “No. 85 Cell Vent”, Sandell Cell Vents, or an approved equal.

J. Latex bonding agent – Shall be non-re-emulsifiable in the presence of moisture and shall have no less than 50% internally plastered solids.

K. Pointing mortar for precast concrete – Pliable sealant with sand finish as follows:

1. Sealant shall be Dow Corning, 790, Tremco Spectrum 1, Pecora 890, GE Silpruf SCS-9000 NB silicone building sealant or approved equal in color(s) chosen by the Architect to match mortar, meeting the following minimum requirements:
   a. TT-S-001543A (COM-NBS) Class A.
   b. TT-S-00230C (COM-NBS) Class A.
   c. ASTM C-290 Type S, Grade NS, Class 50, Use T, NT, M, G, A, O.
   d. SCAQMD, Rule 1168, for low-VOC sealants.
2. Sand – Clean washed sand, color and texture closely matching adjacent mortar.

2.04 GROUT AND DRAINAGE FILL

A. Grout shall conform to ASTM C476 "Grout for Reinforced and Non-Reinforced Masonry," Type Fine.

B. Aggregate for grout shall conform to ASTM C-404.

C. Drainage Fill – 3/8 inch minus washed peastone.

2.05 REINFORCEMENT, ANCHORS AND TIES

A. Reinforcements

1. Reinforcing Steel bars for vertical cell and bond beam reinforcement at CMU shall conform to ASTM 615, Grade 60, in sizes, quantities and frequencies shown on the Drawings.
2. LEEDv4-S Requirement: Steel reinforcing shall be manufactured using minimum 95% recycled content
3. Reinforcing Bar Positioners: Wire units designed to fit into mortar bed joints spanning concrete masonry unit cells with loops for holding reinforcing bars in center of cells. Positioners shall be formed from 0.142 - inch (3.6 mm) steel wire, hot-dip galvanized after fabrication. Bar positioners shall be: Hohmann & Barnard: #RB or #RB-Twin Rebar Positioner; Heckmann: No. 376 Rebar Positioner; Wire-Bond: O-Ring or Double O-Ring Rebar Positioner or approved equal. Provide units with either two or four loops as needed for number of bars indicated on the Drawings.
4. Continuous horizontal reinforcement of all exterior and interior CMU shall be 9-gauge hot-dip galvanized wire with prefabricated corner and prefabricated tee units provided at all intersections. Width of horizontal reinforcements shall be 1-5/8 inches less than overall wall thickness. Horizontal reinforcement shall be Hohmann & Barnard No. 220 ladder design at vertically reinforced walls and partitions; Hohmann & Barnard No. 120 truss type at all others; or similar products by Heckman, Wire Bond, Tru-mesh, or approved equal.

B. Anchors

1. Rigid Partition Anchor ("Bar ties") at intersecting CMU partitions: ¼ in. x 1-1/2 in. x 2'-0 in. hot dip galvanized steel ties with ends bent two inches and placed 32 inches on center vertically, Hohmann & Barnard: No. 344, Heckman: No. 140, or approved equal.

2. Slotted Anchors at structural steel: hot dip galvanized steel slotted channels (12-gauge by 7-1/2 inches by 3/8 inches) welded to structural steel and compatible hot dip galvanized steel anchors (1/8 inch by 1-1/4 inch in lengths sufficient to turn into masonry web). Hohmann and Barnard: Gripstay Channel System, or similar anchors by Heckman or approved equal. Furnish slotted channels to SECTION 051200-STRUCTURAL STEEL for installation.

3. Anchors welded to structural steel: adjustable hot-dip galvanized steel anchors welded to structural steel and 3/16" hot-dip galvanized diameter box ties with moisture drips. Hohmann & Barnard, No. 359; Heckman Building Products, No. 317, or approved equal. Furnish anchors to SECTION 051200-STRUCTURAL STEEL for installation.

4. Anchors at CMU perpendicular concrete walls: 1/8 in. x 1 in. x 3-1/2 inches, stainless steel or hot dip galvanized, with one end dovetailed and opposite end turned down approximately two inches into block cavity: Hohmann and Barnard: No. 304 or similar anchors by Heckman or an approved equal. Slots for anchors: hot dip galvanized steel, min. 22 gauge of approved design. Hohmann and Barnard: No. 305 galvanized slots or equal. Furnish slots to Section 033000-CAST IN PLACE CONCRETE for embedment into the concrete.

C. Veneer Ties

1. Ties for exterior masonry veneer backed by sheathed LGMF walls shall be thermally broken, two-part screw system. Anchor shall consist a self-drilling threaded screw and barrel shaft with seals to cover holes at the vapor barrier and at the face of the insulation. Length of barrel shaft shall be sized to suit depth of materials penetrated, Pintle type ties shall attach to reinforced plastic wingnut/thermal clip. Ties shall penetrate at least 50 percent of the masonry wythe thickness. Minimum 4 inch size ties, 5 inch where required for specified penetration. Ties shall be Hohmann & Barnard: Thermal 2 Seal Wingnut anchor/2x hook; Heckman: No. 75TC Pos-I-Tie with thermal clip/No. 282 wire ties or approved equal.

2. Ties for exterior masonry veneer backed by CMU & concrete walls where walls are insulated shall be thermally broken, two part screw system . Anchor shall consist a threaded concrete screw and barrel shaft with seals to cover holes at the vapor barrier and at the face of the insulation. Length of barrel shaft shall be sized to suit depth of materials penetrated, Pintle type ties shall attach to reinforced plastic wingnut/thermal clip and shall penetrate at least 50 percent of the masonry wythe thickness. Ties shall be Hohmann & Barnard: Thermal Concrete 2 Seal Wingnut anchor/2x hook; Heckman No. 75TC Pos-I-Tie with thermal clip/ No. 282 wire ties or approved equal

3. Ties of exterior masonry veneer backed by uninsulated concrete walls: (Cashman retaining wall):shall be hot dip galvanized flexible dovetail brick ties: Hohmann & Barnard No. 315 Vee-Byna, or similar anchors by Heckman or approved equal. Slots for dovetail masonry ties shall be hot dip galvanized steel, min. 22 gauge: Hohmann and Barnard No. 305 galvanized slots or equal. Furnish anchor slots to Section 033000-CAST IN PLACE CONCRETE for embedment into the concrete.

4. Ties for interior masonry veneer backed by LGMF gypsum wallboard construction shall be mill galvanized corrugated buck anchor, 14-gauge x 1-½ inches wide, in length as needed for veneer conditions. Hohmann and Barnard No. 345 or similar ties by Heckman or approved equal.

2.06 PRECAST CONCRETE LINTELS, CAPS AND BASES

A. Precast to indicate profiles, from 5000 PSI 5% air entrained concrete, with steel reinforcing and stainless steel dowels and anchorage's. Unless otherwise shown on the Drawings, provide in single lengths. For long continuous sills, provide minimum 8 ft. long segments unless shown otherwise on drawing. Precast concrete shall have second finish. Color shall be equal to MGA Cast Stone: Dove Gray.

B. Reinforcement and stainless steel anchorage, dowels and ties shall be furnished and installed as shown on the drawings and the approved shop drawings, and by job conditions to properly anchor the precast sections.

C. Coordinate fabrication of precast building trim with items by other trades, such as electric clock, ground mounted flagpole lights, flagpole, and fire alarm beacon back box.

PART 3 EXECUTION

3.01 MASONRY WORK IN GENERAL
